Hello all,

I'm a new subscriber, and looking for some information on the 8525 radio. I am looking at purchasing one with a multi tapped whip, but curious to look at a pic or some details on it.

Regards,
Paul

For Sale

9323 Remote Unit - Auto tune antenna - all cables, brackets etc,
Telstra, RDD, RFDS, WICEN, 4X4, 27mhz CB, and a host of listening freqs.
$2500

Regards

Paul

4. Help! Technical advice sought for 8422 Selective Call Unit.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2000-03-25 00:23:43 UTC
From: Peter P
Topic: 4 Message: 4

Hi everyone,

I am new to this list, and I start with a question (doesn't everyone?). I am trying to fix a problem with this 8422 selcall box, it outputs a permanent 5 volt p-p squarewave at 100 Hz from it's audio output line. It appears to be a problem within the main processor chip, power supply and other external connections look fine on the CRO. The signal disappears when the clock crystal is removed. I notice there are not too many subscribers on this list, so I am probably a bit optimistic!
Any help would be most appreciated,
thank you,
Peter.

5. Codan 8727 and 7727

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2001-01-25 16:04:52 UTC
From: Phil L
Topic: 5 Message: 5

Can anyone give me some pointers to where I could find info about these radios? (8727 and 7727) I have an opportunity to buy one or more of them, and I was wondering what I should be looking out for, also, what sort of frequency range they can be used with... What sorts of modifications are commonly performed, how easy are they to program, that sort of stuff....

Thanks for any help....

Phil
If you want a 7727 make sure its a C model. They are only a 5 or 10 channel radio, crystals control freq up to 15mhz (from memory) I would not pay any more than $200 for a really good unit. 8727 is not much better. I would try and find a 8525B at least, then you can use the auto tune antenna. They can have up to 501 channels if you put a 8528 head on them, else they are 99 chl. Eprom controlled up to 29 mhz

The 8525 is a 99 channel that also can have a auto antenna as long as
you have the option connector there are 2 models of those radio as
well the a model uses a 27c256 eprom and the b model uses a 27c512
eprom if you change the firmware in the b model you can turn the
radio
into a 8528 as well but remember you must use a 8528 head or the 8528
outback pack also the 8528 has more features but if i remember it is
a
400 channel radio

Hi.
I have just subscribed to this group and look forward to hearing from eveybody. I run a 92 Landcruiser trayback with dual batteries . The Codan 8528 is a fairly good radio but missing in some areas such as any type filtering for the audio. When I intially got the radio it was slightly off frequency but once that was fixed goes like a rocket. I have the amateur radio frequencies in it and intend to hook it up to a KAM plus using a laptop. I like doing mobile Slow Scan Television (SSTV)and other digital modes. I have already priced the new NGT's but they are starting to expensive (AUS$3800) and 8528's virtually have no trade in value. Has anybody modifyed any remote heads in any way, wud be interested to hear about, but mainly the audio to clean it up

Graeme

Thanks for the info on the eprom's. I was warned by someone to
ensure that if looking at an 8528 to make sure that's what it actually is.
Makes sense now.
Also explains why I have seen 8528 head units advertised on their
own.
OK. I'll be looking for the 'B' model 8525 or an even better an
8528, to replace my antique 7727.

Cheers

Graeme, I have never had a problem with the audio on the 8528. If it is distorted it may need a bit of a tune up.
Also if you run the lead to the control head on the same side as the coax and DC you will get distortion (apologies if I'm teaching you how to suck eggs) Have you got access to the codan buggery box for tune ups?
Ben

Topic: 9 Message: 17

He's right. The 8525A was a 99 channel radio. It was designed for tapped whip antennas only. However, there was an add on box that was about half the size of the set to run the old 'moonraker' antennas. Steer clear they are useless.
(the 25A itself is ok) 25A could only tx up to 16Mhz

8525B was almost a completely different radio. It still used the same control head as the 'A. It was also 99 chl and could TX to 24Mhz

The 8528 is the one that has the LCD display. They are a 501 channel set plus up to 99 P-channels (user programmable) giving it up to 600 channels. It will TX to 30Mhz depending on what EPROM you have.

Bothe the 8525B and the 8528 will run the 8558 autotune whip as long as you have option AD. (antenna driver) installed. They will both run a 9350 antenna with option AD removed. the 8558 is the cylindrical base, the 9350 is the tapered plastic base.

The 8525B can be turned into a '28 by changing the EPROM and the control head. They will then tx up to 30mhz
if you have the right options as they have exactly the same PA stage.
If you wish to use telstra radphone or other telephone interconnect services you will need a 8528 (or modded 25B)
8528 depending on options can do the following
selcall
rfds emergency call
tone call
USB/LSB
program tx freqs from front panel
TX amateur bands
CB / Marine CB freqs
program scanning of a range of frequencies continuously
radphone
storing of phone numbers

Hope this helps
Ben

Graeme, do you want a basic profile with no freqs, or one with rfds, telstra radphone and cb?
If you already have an 8528, you can just read your existing eprom and add to the profile thats created when you read it.

Hi All,

It is great to see a group set up for these great radios. I have a
9323
and a 8528. Both are remotes and sitting in my cupboard at the moment
as I have sold my 4wd. I am thinking of setting the 8528 as a base
station. Does any one have the job file for Option "A" (a job file
for
amuater freq.) If you have a copy of it and don't mind sharing then
please email it to me.

Thanks ALL

Lobo

I am currently putting together a website on Codan 8525/8528 radios

Anyone interested, it can be accessed from

www.ozradio.50megs.com and follow the links to the codan section

Feel free to make any suggestions to what info you would like to see on the site.

Hey all,

Just found this little group and thought I might keep my ear to the ground. Some info for ya....

I have Landrover Disco set up for O/B touring and have a 9323 remote with autotune ant etc...

I have, in the past had 8525 with Moonraker Ant (Yuk-the ant was woeful), 8528 with 8558 Autotune (Better)Barrett 550...now the 9323.

Have a reasonable knowlege of the 9323 and am studying for Amateur ticket. Easy to get it onto amateur with no mods.

Will keep watching.

Mark

Boy, I know it's a long time ago, Paul, but did you sell the Codan 9323 and buy an 8525? If so, why? The 9323 is a much better set!

Ben, the only audio probs I have is a result of the lsb xtal install
on the lower two amateur bands.
Btw what is the codan buggery box for tuning ?
Cheers
Jim

Jim
Does the audio sound like 'Darth Vader'. If so the set may be off freq on
LSB.
There is a spot on the pcb for adding a cap to adjust freq. Haven't got the
manual in front of me at the moment to
tell you exactly where.
The codan buggery box is a two tone and white noise generator the plugs into
the mic socket for adjusting the IF stages.

OK. I have finally offloaded the old 7727TB and am currently in search of a later model unit.
Couple of prerequisites:
1) Must have SelCall/Telcall functionality
2) Preferably programmable (ie No xtals)
3) Not fussed about Autotune (either/or)

Which really narrows it down to an 8528 or 9323 (And I guess latter model 8525's)

Anybody seen any or want to get rid of same.

Stephen Mazza

Hi

Our Local Radio Club has recently been donated a Codan 6801S Mk2B Marine transceiver which we intend
to put on a fixed 7mhz frequency for club broadcast purposes. The transceiver has a problem with the tx side - is there a circuit diagram or workshop manual still available for this rather elderly transceiver. We would of course be prepared to purchase the manual or pay for photocopying etc. if one is available. There is enough technical expertise available to the club to do the conversion if a circuit diagram or wshop manual is available to assist with fault finding.

Hoping you can assist. Please reply direct to:
munns@...

Larry

Please Do not open any unexpected email attachments
especially from your friends

it is a simple matter to email the sender and ask if they did in
fact send an attachment.

A nasty new virus is sweeping across the Internet clogging up
servers and email boxes.

This is the Sircam worm. Information on the virus and its impact
can be
found at URL
http://www.symantec.com/avcenter/venc/data/w32.sircam.worm@...
l

Cleverly it seems that .exe files can be made to look like other
files.
The only files I am brave enough to open now are .RTF (rich text
files)

According to McAfee, the virus can choose from a variety of file
types,
including .GIF, .JPG, .JPEG, .MPEG, .MOV, .MPG, .PDF, .PNG, .PS,
and .ZIP files"

I have had this virus now 6 times sent to me today.

I deleted it each time.

The last time it cleverly looked like some Community
Development Business from Queensland :
109 Mc Dowall st (the old Maranoa Club)
This is designed as a
casual meeting where questions are welcomed throughout the
speakers

s
What are the training needs of the community and how is best
to deliver these needs
.

To be safe you must use a firewall and an antivirus program,
and an email program like Calypso which encrypts the address
book
so the virus can still infect your computer but not infect
anyone else as
it cannot read your address book.

To find free fire walls and anti virus programs and Calypso
Email program now free but unsupported
use google search engine and choose the one you like.

Using the Internet without firewalls and antivirus programs is
akin to indulging in unsafe sex.

If you want safety in good backups then buy for approx $200 a cd
burner and a packet of 50 cd's
at a bout $1 each they hold 700 megabytes each, keep a second
copy in another separate building.
then you can rebuild everything if disaster strikes and it will
one day if only it is your hard disk dying.

33. 8528 SSB Query

Yahoo group: codan_outback_radio (1997 — 2004)

From: M0ctl@aol.com
Topic: 33 Message: 33

Hello every one,

Nice to see that there is a group for this great series of radios, sadly I have little to no information on this wonderful radio. I have with the help of Bens web site managed to program my radio, and a fine set it is. I need to know if LSB is an option that needs to be fitted, or have I got a fault with LSB on my radio.

When I select 'UL' on my 'P' frequency input routine I have full use of the USB/LSB button, when I switch to LSB the audio falls to nothing and it does not transmit. Have I got a fault??? (Sorry for being so thick!)

The Radio I have is Ex Camel Trophy dated inside 24 oct 1991 the Eprom has a code 90-20278.700 Ver.3.1 ISO U01914 Sno. B2083 Serial of the Radio is also B2083.

By the way thats a hell of a chrystal filter in there !!!

Thanks for any speedy replies you can give as I need to get on to the seller if this thing is faulty...or repair it, whatever because even as it is its the best SSB radio for 17m I have ever used.

Regards, Steve Ball (M0CTL) UK England m0ctl@...

PS Maybe someone outhere has a scanner and a cicuit diagram for this kit, never know help may be just around the corner....

The LSB option requires a crystal (about $45 from codan) be fitted, as well
as programming the eprom.

Here is the latest after a days work...!!!

Still no LSB !!!

I have checked both VCOs and both lock absoluteley perfectly only flashing the LEDs thru a channel change. The voltages are crack on.

I have injected an RF signal into the antenna socket and nothing can be heard from the speaker except faint mush in LSB. There is also no TX on LSB. USB works correctly as it should and bang on frequency.

Checked a few of those dreaded tanty caps around the oscillator circuit but all is well. I have spoken to the UK dealer who says if the mode selection U UL L is working in P-channel mode it should work. You make reference to having the correct Eprom, I would guess if those options are not visible on the display then they are missing from the Eprom programming ie. L for LSB. However it exists in the programming sequence menu and I expected the L function to to be there and work on the radio...strange..

He told me of a very strange circuit that enabled the LSB signal to be fed thru the filter as does the USBs path, and frankly lost me a bit in his description.

I must get this fixed as its no use for 40m and 80m without this working. I like the CW mod on your page, Is this how the option is fitted by the factory?

What oh what do you think could be the problem, its damned hard work without a manual I can tell you. The UK dealer wanted £85 +tax for the manual, only in French!! and £40 for the mounting bracket, These may be old radios but the prices are bang up to date.!!

Thanks for the help again Ben.

Regards Steve.

Made some progress here Ben,
removed the oscillator PCB after listening around the crystal with my HF reciever and sure enough the osc.was not running at all.

Removed the xtal and it rattled ever so slightly only in one direction, this was confirmed by my wife, on passing it back I dropped it three feet onto a carpet floor in my lounge, it then REALLY rattled. My guess is that as you say it was bust, maybe one side of the contact had come dislodged and the drop finished it off.

These H6/u crystals are usually built like battle ships and I am sure dont fail this easily, if this radio is truly Ex Camel Trophy it could well have been vibrated to death...

I have lodged quotes with both HyQ and a QuartzLab to find out the manufactured price of this crystal, if its comparable to SMCs price in the UK (Codan dealer) then I will get it off the shelf.

One more point I would like to discuss is the 'Filling up of Channels, until the Eprom wont accept any more' Please expand on this as I dont quite see how the eprom can be 'filled' up with P channels to the point of not accepting more, I understood they could be overwritten again and again. You lost me there...

Anyway thanks for the help Ben

Cheers, and look forward to viewing your additions to the page at some time.

PS will copy you the data from the EProm when this fault is cured, wouldnt want to risk introducing another just at this point, I am sure you understand. By the way the selcall PCB is missing so I guess thats where that edge switch would have connected to, mystery solved...

All the Best Steve.

Steve,
The eprom can not be filled up by P-channels, they are stored in non volitile RAM on the micro board.
Each time you add channels to the eprom via the programming software, it adds a bit more to the eprom,
and eventually fills up, about 5 to 6 'sessions'
Ben

Hi again all,
I have just managed to get hold of a another Codan 8528, this one is perfect in every way and has not been butchered on the front panel with an edge switch and key switch for selcall. This one has the same wide coverage, Ham Band, and 10w CB Eprom.

I have swapped some gear for SGC230 Smartuner that should be here before the end of the week. The only thing I am missing at the moment is a mounting bracket. Codan UK want £40 for the bracket. Does anyone here have a second hand bracket that they are willing to ship for a reasonable price to the UK?

Spent quite a lot of time playing with the controls and getting to grips with its functions, like 2 presses of the 'recall' switch will reduce the dial light brightness to a pre determined level adjustable behind the display PCB. (LCD contrast although it is refered to as 'angle' is also adjustable from the rear of the display PCB)

There seems to be a knock out with a plastic bung on the rear panel on the opposite end to the antenna socket. Anyone know what thats for?

Does the selcall form part of the main eprom PCB or is this an option board. The reason I asked this is that I have in programming a channel, input a call string and my own ID string and it appeared to accept this and when selcall button was pressed a Tx was caused into my dummy load. I will accept that I was not monitoring the thru audio so was really unable to tell if the string was sent.

I have also got a 109 inch whip and spring-ball mount fixed to my rack on the van, so I will let you know how the installation progresses.

Bye for now Codan'ers

Regards Steve

PS. I am now beginning to know quite a lot about this radio...

Why buy one for that price , make your own mounting bracket. I run an 8528 , and ended up making the transciever mounting bracket and the bracket to mount the remote head.

Steve, the selcall board fits to the right of the micro board (with the connectors facing away from you)
The plastic bung is for a 4 pin socket that is used for an external selcall alert or auxillary power to another unit such
as a 8570 remote control interface. If the selcall is being sent you will hear a warbling sound in the speaker as it TX's

Ben

Hi again all,
I have just managed to get hold of a another Codan 8528, this one is perfect in every way and has not been butchered on the front panel with an edge switch and key switch for selcall. This one has the same wide coverage, Ham Band, and 10w CB Eprom.

I have swapped some gear for SGC230 Smartuner that should be here before the end of the week. The only thing I am missing at the moment is a mounting bracket. Codan UK want ?40 for the bracket. Does anyone here have a second hand bracket that they are willing to ship for a reasonable price to the UK?

Spent quite a lot of time playing with the controls and getting to grips with its functions, like 2 presses of the 'recall' switch will reduce the dial light brightness to a pre determined level adjustable behind the display PCB. (LCD contrast although it is refered to as 'angle' is also adjustable from the rear of the display PCB)

There seems to be a knock out with a plastic bung on the rear panel on the opposite end to the antenna socket. Anyone know what thats for?

Does the selcall form part of the main eprom PCB or is this an option board. The reason I asked this is that I have in programming a channel, input a call string and my own ID string and it appeared to accept this and when selcall button was pressed a Tx was caused into my dummy load. I will accept that I was not monitoring the thru audio so was really unable to tell if the string was sent.

I have also got a 109 inch whip and spring-ball mount fixed to my rack on the van, so I will let you know how the installation progresses.

Bye for now Codan'ers

Regards Steve

PS. I am now beginning to know quite a lot about this radio...

Steve,

Do you may be have chance to read out EPROM from old
or new unit. Me and some other people including Ben
are looking for HAM "A" type of file.
Concerning bracket may be some chance to get one
when I am back from holidays, in case I am lucky
can ship easy to you from site within EU. (I am in 9A now)

Regards
73 Djani

From: M0ctl@aol.com
Topic: 44 Message: 44

Hi there,

Waiting for the Xtal for the SSB section, as soon as this is installed and tuned/proved working I will get the Eprom data for you. I dont have read/write facilities here so I will have to get this done with the help of a friend. I will do it as soon as I can possibly arrange it, thats assured. Just bear with me for a short while.

I did not want to run the possibility of introducing another fault until I have got the other set working on LSB. I am Using the fully working one as alignment reference and voltage checker. I have no manual.

Its nice to be able to help. Ben said it was unusual for such an early Eprom to have on the fly Ham Band tuning and the 10w CB mod.

Can you tell me how you want the data, not knowing a great deal about blowing/reading of Eproms, I assume its just a raw data file. Would you want it read using any particular software or package. Best to be sure.!

Hope to hear from you soon.

Regards Steve m0ctl.

45. Amateur eprom.

From: Ben
Topic: 45 Message: 45

Hi all. Guess what!! I got my hands on the option A eprom V5.8 (amateur)
Will have a play with a few channels in it and make it available.

Send me an email direct with your name & callsign & I will email the .bin
file to you in the next week or so.

You will just have to find an eprom burner. If you don't have access to one,
let me know and I may be able to work something out.

The file I have does not have option TXE, only TXD which means you have to
enter extra P-channels by shorting the micro link inside the radio - see my
website. But it does allow access to all amateur bands from 2mhz to 30mhz

email to hobbo@...

cheers Ben

Guys, are there any regional differences between frequency allocations in Oz and UK to consider ?
I have all the Oz amateur HF frequencies in my '28 but don't have a clue how to get the info to anyone else. I assume you use an eprom burner and software.
Mine are stored in P channels I think...great radio if you don't want to tune to far :))
Also someone has told me that there are some mods to use the 8525 on 160m...will post if I get em.
Cheers
Jim

From: M0ctl@aol.com
Topic: 49 Message: 49

Hi,

If its any use the UK frequencies covered buy the 8528 I own are as follows:

3.5 4.0
7.0 7.3
10.1 10.15
14.0 14.35
18.0 18.2
24.8 25.0
28.0 29.7

All programmable channels, with on the fly tuning, slipping to Rx tune only outside these limits. Hope this is a little use.

Regards Steve.

Jim,
just do a read of the eprom in your 'burner'
save the file as a *.bin file start address 0000 hex, end FFFF hex (64k)

There is an option called LF that enables better sensitivity on recieve of
1.6 to 2mhz. It is just a 1nf cap.
As far as TX goes I don't know. The lowest I could enter on my set was 2mhz

Ben

Hi All,
I guess the responsibility ultimately lies in the user to ensure they are licensed for that frequency despite what the radio will do!

Hi,

I think that comment is probably true, as these radios will work virtually anywhere between there spread, However here is the UK HF band plan for information.

UK HF Amateur Radio Band Plan

1.8 MHz (160m)

LICENCE NOTES:Amateur Service: 1.810 - 1.850Mhz, Primary, Remainder secondaryAvailable on the basis of non-inteference to other services (inside or outside the UK)Satellite Service: No AllocationPower Limit: 1.810 - 1.850MHz: 26dBW PEP. Remainder 15dBWPermitted modes: Morse, telephony, RTTY, data, fax, SSTV

1.810 MhzCW Only
1.838 MhzDigimodes (and CW but excluding AX25 packet)RTTY (Baudot is the preferred mode on this band)Phone may be used above 1.840
1.842 MhzPhone (and CW)1.843 QRP
(1.950 - 2.000 Novice)1.960 DF contest beacons (14dBw) 12.5 b/w max.1.970 Provisional Novice calling freq.
2.000 MhzNote: AX25 packet should not be used on the 1.8MHz band.END OF BAND

3.5 MHz (80m)

LICENCE NOTES:Amateur Service: Primary, Shared with other servicesSatellite Service: No allocationPower limit: 26dBW PEPPermitted modes: Morse, telephony, RTTY, data, fax, SSTVUnattended beacons: Only for DF contests SAT/SUN only, 14dBW ERP PEP max.

3.500 MhzCW only 3.500 - 3.510 Priority for CW intercontinental working3.500 - 3.560 CW contest preferred segment3.560 QRP(3.560 - 3.580 Novice)
3.580 MhzDigimodes (and CW)3.590 - 3.600 AX25 Packet frequencies(Phone may be used and has priority above 3.600 MHz)
3.620 MhzPhone and CW3.620 - 3.650 Novice3.600 - 3.650 Phone contest preferred segment3.690 QRP3.700 - 3.800 Phone contest preferred segment3.730 - 3.740 SSTV/fax recommended 3.775 - 3.800 Reserved for inter-continental phone working 3.800END OF BAND

7 MHz (40m)

LICENCE NOTES:Amateur services: PrimarySatellite Service: PrimaryPower limit: 26dBW PEPPermitted modes: Morse, telephony, RTTY, data, fax, SSTV

7.000 MhzCW only7.030 QRP
7.035 MhzDigimodes (and CW, SSTV, FAX, but excluding AX25 Packet)(Phone may be used above 7.040) 7.045 MhzPhone (and CW)

7.100 MhzNote: AX25 packet should not be used on the 7 Mhz bandEND OF BAND

10 MHz (30m)

LICENCE NOTES:Amateur Services: SecondarySatellite Service: No allocationPower limit: 26dBW PEPPermitted modes: Morse, telephony, RTTY, data, fax, SSTV

10.100 MhzCW Only10.106 QRP(10.130 - 10.140 Novice) 10.140 MhzDigimodes (and CW, but excluding AX25 packet)(Unattended digimode stations should avoid the use of the 10 Mhz band)
10.150 MhzNote: AX25 packet should not be used on the 10 Mhz band.END OF BAND

10 Mhz Band Plan Notes:The 10MHz band is allocated to the Amateur Service on a secondary basis only.Therefore IARU have agreed on a worldwide basis that only CW and digimodes, being narrow bandwidth modes, are to be used on this band.Likewise this band is not to be used for contests or news bulletins.

14 MHz (20m)

LICENCE NOTES:Amateur Services: PrimarySatellite Service: 14.000 - 14.250: PrimaryPower limit: 26dBW PEPPermitted modes: Morse, telephony, RTTY, data, fax, SSTV

Hi all
quick instructions on using option A

select the channel on amateur band. Note the channel number is the metres for the band.
The freq will be somewhere in the middle.
press the tune fast or slow up or down buttons. The display will change to TUNE TX with the freq.
you can either keep pressing the tune buttons or;
press enter button, type in the freq you want. press enter.

You can also add you favourite freqs to P-channels

58. Pulse noise from High pressure Diesel System

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2001-08-04 16:46:14 UTC
From: M0ctl@aol.com
Topic: 58 Message: 58

Hi again..

Heres the latest teaser.!!

Installed the 8528, Smartuner and 108" Whip On the Rack of the van, Perfect except for high level pulse noise from the diesel injector system. Mainly at its worst on 18Mhz. At any engine speed.

The van is a Fiat Scudo 2.0l Turbo diesel, the Peugeot Equivalent is the Expert Model. Infact any late Pug HDI Diesel has the same engine.

When you drive into an area between buildings the pulse noise reduces. On the open road, the pulse noise is just as if the engine was petrol, increasing with revs except that when you lift off the throttle completely the noise stops completely and lets the AGC open up the Rx as it should be.

This is a weird one, Here is the state of play so far..

Battery supply direct from battery
Smartuner Well grounded, all panels grounded well also.(Tunes up perfectly)
This is not supply noise its RF I think and is going to be difficult to cure.

Have tried various supply/grounding combinations,
Antenna is as far away from engine bay as possible.

ANY SUGGESTIONS ANYONE ?????

Thankyou.

All the best Steve. m0ctl

59. Re: [codan_outback_radio] Amateur eprom.

From: Graeme
Topic: 45 Message: 59

The eprom's used in the 8528 is a 27C512 and in the 8525 is a 27C256. They cost about AUS$10 brand new. A good source of eproms are the old 386 and 486 motherboards plus old video cards from the same era. If you handle them eproms make sure you have an eprom removal and insertion kit otherwise you will damage the eprom. My problem was not getting the eproms but trying to clear the old memory. Proper UV erasers being somewhat expensive I went to my local hairdressing salon and asked if they had the old ultra violet sterilizer that were used some years back to sterilize scissors and the like. They were more than glad to give me there sterilizer as it had not been used for years and was taking up space. It contains two uv lamps. It is capable of doing about 100 eproms at a time so it is somewhat of an overkill but it did not cost me anything. Though it might interest the group
I have being doing some reading up on trying to clear up the audio at the speaker (not inside the transciever } and came across the following product on the interent. What this product does is use DSP (analogue into digital and then back to anologue with a clearer signal) and then to the speaker itself. It must have a seperate 12 volt supply running to the speaker to power the DSP circuit board. Below are the url's if you wish to have a look.

http://www.nct-active.com/csspkr.htm

http://www.amcominc.com/productdetail.cfm?Prod_ID=16

Graeme.

PS> If you have the amateur radio bands on your Codan make sure you have ham license before you transmit

Hi. Assume that you have tried caps and chokes on any electricals to do with diesel pump?
My diesel Landcruiser(80) generates no interference at any speed, and thats with no mods at all.

> When you drive into an area between buildings the pulse noise reduces

That definately sounds like RF interference, doesn't it? You have a minature transmitter there! Check any oil pressure/temp senders, they are a well known culprit on some vehicles over here.
Cheers
Jim

Ben,

The best I have found for editing is this ...http://www.bpsoft.com/

If you like the look of Hex Workshop you can down a trial version.

I use this on all my Motorola projects..

Regards Steve.

67. Pulse Noise II

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2001-08-05 13:33:56 UTC
From: M0ctl@aol.com
Topic: 63 Message: 67

OK all,

I have tried screening the injector solenoid cables and earthing in the engine bay, putting the extra braids onto body panels, hood etc and its still there. Have run Smartuner and 8528 off a seperate supply to vehicle battery, so not that either.

However fixing a trailing chain from the chassis to the road has decreased the noise slightly. I think as was pointed out this is an RF emission problem caused by the Injector system and I am going to be hard pushed to cure it.

It is really only on 18Mhz that it becomes a problem whilst the engines running so looks as if I am giong to have to live with it. You could argue that if they are less then s5 you wouldnt work them reliably mobile anyway...but its just that AGC closing down the front end that is so damned annoying.. 7Mhz is crystal clear..

Once more going to prove that there is nothing as strange as radio..

Still be interested in any comments, and suggested cures for this problem...

Regards to the Group Steve.

If its on when stationary(engine running), why not borrow a portable with a ferrite loop aerial or something that you can attach a small aerial to, and then go looking in the engine bay. Keep away from the moving bits :))
Cheers

A friend of mine has used the info on Ben's webpage to get his 8558
tuning reliably. He is now a happy camper. Thanks Ben and anyone else
who has contributed.
There is an unfortunate spin off. A friend of mine was going to sell
me a 8525B. After viewing the website he is now considering selling
me the same radio as an 8528. There is a "slight" price difference !
Damm, me and my big mouth !
And whatever happened to the chap with mobile interference on 18 meg ?
Last seen listening to a radio deep in the engine bay. zzzzzzaP ??
:))
Cheers
Jim

Hellooo..

Still got the Injector noise Jim, but escaped the clutches of the fan belt and things...

I am learning to live with the problem now , although its still annoying. I am concentrating 17m contacts whilst stationary and the engine off, all other bands no problem.. Thanks for asking anyhow.

Wonder if anyone knows the secret button, and if it infact has a function on the 8528. It lies between the Call and Emergency Buttons, there is no identification and its there.... Also there is an LED between the USB and LSB indicators, is this for DSB? Just found these things out and was musing on their function.!!

Thanks again all, Regards Steve.

PS Does Skinny want a scan or two of the PCB layout of the Philips PRM8010/20. Just let me know.

Steve
The extra led on the USB/LSB is actually for the marine version. That switch is used for power setting. LOW/MED/HIGH. They use the same control head/LCD but a different stick on face. The extra button is used for options specific to a fleet. Example Ambulance may allocate it to a Group Selcall function. This is programme into EPROM on order from CODAN.

From: Greg Harewood
Topic: 76 Message: 76

Hi guys - here's a simple one - I have an 8528 - extended control model (the bigger one - with speaker in built) After reading the user manual (downloaded from Ben's site - good stuff!!) I have established that I have no backlighting on the display. Is it suppose to or have I got it wrong? You certainly can see nothing when its dark. Is it possible to turn this off without knowing or is the globe(?) blown. If it is some sort of globe can I fix it easily or is it a job for someone who knows what they're doing (i.e. not me)?

Thanks for your help

Greg Harewood

Greg,
The bulbs are in either of 3 states
1. on
2. dimmed.
3. blown

you need a good solder sucker and lots of patience.
The bulbs are mounted behind the LCD. You have to remove it (48 pins) to get
to them.
They are 5v, 60mA 'grain of wheat bulbs'

Hi All
Looking for any of you, fellows, who has any experience
or knowledge with I2C command set for Codan 8528.
My intention is to use second I2C address with one
converter to RS232 to provide control of radio
over desktop or handheld PC.....
May be we can set up shared project here, or
on Ben's pages!?

Djani,
that sounds like a pretty ambitious project!!. I'd be glad to put any info
on my website , with due credit of course.
The later 9323 can be controlled this way. May be a clue there.
Unfortunately I'd be a bit over my head with that one. I am at the moment
trying to crack the hex code so I can add extra channels that the
programming software wont allow. ie 24mhz to 30 mhz.
Good luck!!
Cheers Ben

Ben,
I am testing interes of audience here to find helping
hand(s) for such project (I2C -> RS232).

Concerning HEX hope my Polish emulator is doing
good job for your efforts. I use them for same purpose
but seems that 8528 unit is checking whole EPROM on checksum
base, therefore after my attempts for direct editing unit starts
and works fine for first 4 sec then EPROM ERROR mesagge
occurs and all stops. Latter I find routine which acctualy makes
dead end (652E HEX) and use it to reboot unit but that results with
4 second short interuptions. I am still searching for checksum routine
to
disable it, but as you know it is not easy to find it within 4-5 milion
of CPU clocks.

I doubt that you will find just a 2nd hand autotune ant anywhere as these types of radios are normally sold as a package. You may be able to adapt some other system such as and ATU unit with a Stainless whip, but certainly not as convenient.

Mark

Hi there,

I use the SGC Smartuner with my 8528 and 108" S/S Whip up top, very convienient and quick to tune....anywhere above 80m.

You would need some loading or a bit more wire for use at lower frequencies.

Just a thought.....

Steve.

PS they have a nice Web Site. http://www.sgcworld.com/

91. Re: Barrett 550

The tuners look great. Unfortunately one of my requirements (like many others)is the ability to scan several frequencies and I can't see that happening with such a setup.

Cheers

Greg, I have the software and lead details for the 9323. I hope to post on my website soon.
Any options such as CB, Amateur, Sideband are only available by suppling CODAN with the
sets serial number, parting with some $$$$ and entering the code they supply you into the set.

Cheers Ben

Hello to all on the list,

I have been lurking and listening here for a while with nothing to say,
mainly because I don't have a Codan radio to talk about.
However now I am actively looking for an 8528, can anyone give me a clue
what the going price is for one of these?
Anyone want to sell one?

all comments appreciated,

Best regards,
Terry

Terry,
It depends on a few things.
I have a mate who purchased a '28 with 8558 antenna for $200, another mate who swapped a CB and $400 for one. I have seen them usually in the $1000 to $1500 range. It also depends on what antenna , if any is being offered. Pay more for a 9350 antenna, although they can be purchased for $700 2nd hand. I would value a 8558 antenna in good condition at around $250. Try and steer clear of early model 8558 with clear plastic tubes inside. Unfortunately there is no easy way to tell apart from pulling them apart but if the serial has an A or B in it, a safe bet its got clear internals. C serials were a mixture and D serials are nearly all the newer black tubes inside. Make sure you get all the mounting brackets as these are expensive - $30 for the control head and about $80 for the transceiver. The antenna control cabl;es are around $70 from codan if not included. It is cheaper to buy the cable complete from codan than buy the connector from farnell and make one up. The control head cable can be made easily.
If the radio comes with a 8558 antenna, make sure the option AD board is fitted.

have a look at http://www.outbacker.com.au/022nd_hand.htm for a bit of an idea. They seem to be at the upper end of the price range. I would rather spend $2000 and get a 9323 if you're looking at that sort of money.

I know someone who is looking to sell his '28. I'll ask and see if they are still interested.

Cheers
Ben

Topic: 9 Message: 101

Hi
There are two types of 8525 radios. The A model and B model. This can be determined by the prefix on the serial number.
Both 8525B and 8528 will accept the older 8558 autotune antennas as long as the option AD board is fitted. They will both accept the newer 9350 without option AD fitted.
8525A will run a 8558 antenna with the external 8551 tuning box

If it's an A model it can not be upgraded without replacing half the PCB's , including PA in the radio
If it's a B model you're in luck. The only difference is the eprom and control head.
To upgrade you need to change the eprom to an 8528 one.
If your radio has the 'remote control' connector (15pin D range) on the back of the radio it is simply
a matter of plugging in the remote control head and bingo.
In the case of a local unit, just disconnect any connectors inside the radio going to the local panel and use the 8528 remote head.
There are three heads for the 8528
1. 8531 type head, large head with inbuilt speaker. This is basically the same as the local control faceplate built into a seperate box.
2. 8532 head. Standard LCD remote head with black panel behind the buttons. no inbuilt speaker
3. 8533 head. Similar to #2. This is the 'outback pack' as mentioned. It has a grey panel with Outback Radio telephone printed on it.It has extra buttons for OTC selcall which allowed direct telstra radphone dialling. I beleive telstra no longer support direct dialling from 8528's as it is too easy to change selcall ID's and use someone elses account. 9323's support it as the radio's serial number is sent with the selcall.
The 8533 head needs the 8533 eprom profile to support the otc selcall . Not worth worrying about as you can still use standard codan selcall to place an operator assisted radphone call.

In summary you need the remote interface in the radio, remote cable - easily made yourself.
& control head which may be hard to find.

Cheers Ben

Hi Ben, Jim and Mazza, and all the rest.

Thought I'd finally get in and have a look at the email here, plus ask a question.

My 8528(A) had the 27Mhz freq's in the original eprom, does thsi mean I still need to mod the radio to transmit, or does it mean that I can happily transmit without frying the radio.

Although I have the amateur freq eprom I would like to go for the TXE option (wouldn't we all). Was this an eprom option or hardware or combination. I can't find anything in the service manual. I was wondering if it was Link 2,3,or 4 on the main board.....you tried Ben?

Also I have the 8558 and 8525B user manuals in hard copy, Ben you got em, otherwise I'll get around to scanning them for the website.
(I doubt I will score any pdf files for these Jim.)

And Jim what you doing here, I thought you were now a Barrett fan.

Hi Craig. I'll let Ben respond to your questions as I only have some of the answers.(A peek inside to see if the low power lead to the PA is in evidence ?)
As for Being a Barrett fan, my Codan radios here wouldnt like to hear that :)
Like any radio nut I'm a fan on whatever I can lay my hands on at the time.
Cheers
Jim

Craig,
The low power mod will be a jumper wire from the micro board to the PA if fitted. Its pretty obvios.
The option TXE is an eprom option. You also have to permanently link the micro link that you would switch to add p channels in option TXD.
I have those manuals here waiting for time to scan them up. If you have more time than me Craig, you are most welcome to and I'll put on the site.
Chjeers Ben

106. Terlin type whip bases (heatshrink source ?)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2001-09-17 08:41:39 UTC
From: modem@bayside.net.au
Topic: 106 Message: 106

Anyone know where to procure some glue lined heatshrink to put around the Terlin type whip bases. My local electrical supplier has some heatshrink but not this stuff.
The heatshrink stops the base reflecting so much at night, and takes those springs that rust or discolour a bit , out of sight.
It would be better to replace the springs I guess but have no idea of where to get bits for them.

Cheers
Jim

Jim,
I know the stuff you mean. I went out to the shed to see if the shifter I have covered in
the stuff still had the name on it - no luck!
I can't remember seeing it for a few years.
Maybe some silastic under the heatshrink before you shrink it?
Andrews (or was it RFI) made a cold shrink that was fairly sturdy in construction a few years ago.
They may still do. Basically you slipped a length of the stuff over the antenna and then pulled out the plastic
core to make it 'shrink' onto the antenna.
or.. just paint the springs flat black?
Ben

113. Questions about the 8528

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2001-10-04 16:47:22 UTC
From: gumba1uk@yahoo.co.uk
Topic: 113 Message: 113

Hello
Nice to find out that there is a group for Codan radios!!
I have an 8528, fitted with the following options; LU, SD and AD.
In my manual, under specs, transmitted power output, it says; "May be set to any output between 25 and 125PEP. I can't seem to get any more than approx. 70 Watts out. How do I set the output to 125 Watts??
My power supply is the Codan 8540B, 13.8V,20A max.
Thank you in advance
Mike

Mike.
If you look in the PA, on the side opposite the coax connector, there is a resistor labelled 'SET PWR'
I have found form expereience 33 ohms is about the lowest you should go for best power.
in all reallity 90 to 100w is the best you will do and is no improvement increasing to 100w anyway
This will vary upon frequency too.
It also depends un the power meter. My radio measures 50W on one meter, 70 on another and 100 on the service monitor?
You really need an instrament designed for SSB.
If you are going to do a lot of talking, i would suggest backing off on the power a bit. they do get hot!!
Have a look at my site
http://ozradio.tripod.com
for more codan tips
Hope this helps
Ben

Mark, I have several here but from a known supplier(tech who puts em back to specs). This one is from a guy I don't know. It comes with a whip. Hopefully an old Terlin survivor.
By Moonrakers I guess you mean the 8558 ? I've got a couple not working here...will investigate em when I have the time.
Cheers

Jim,
if it TX & RX ok no problem.
Would be good practice to remove every board from the motherboard,
& spray the contacts with a cleaning agent. There were a bad bunch of connectors in one production run.
BTW, if its a local control model, you cant buy speakers anymore from CODAN.

Jim,
The Moonraker is NOT the 8558 antenna, The moonraker was an earlier antenna altogether
& you are right, they are bad news.
The 8558 are still ok, from my experience only a few things go wrong;
The transistors fail on the option AD board in the transceiver
The grease dries up on the stepper motor worm drive,
The early ones had a clear plastic inside, as opposed to a black fibreglass one.
the clear plastic tube breaks very easily. Codan did do a recall on these a few years
back, but there may be a
few still kicking around
Ben

----- Original Message -----

Mark, I have several here but from a known supplier(tech who puts em back to specs). This
one is from a guy I don't know. It comes with a whip. Hopefully an old Terlin survivor.
By Moonrakers I guess you mean the 8558 ? I've got a couple not working here...will
investigate em when I have the time.
Cheers
Jim
-----Original Message-----

I had one years ago and it worked fine. Does it come with an
antenna? If so watch out for the old Moonrakers, they were trouble.

Mark

126. WTB: AutoTune Antenna

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2001-11-18 11:39:13 UTC
From: fraserl@bigpond.com
Topic: 126 Message: 126

Hi All,

Does anyone have a 9350 Autotune antenna they want to sell? I have one here which a eagle decided to take out at 120Kph.

They internals are OK execpt the fiberglass tube. The outer case is U/S.

If I cant get a 9350 I am looking for something that will auto tune. I am going to use as a home base for now until I get another 4WD.

I will use it both on my 8528 and 9350.

Thanks

Lobo

127. WTB 8532 or 33 Head

Peter,
Good luck. Being Codan it would cost more than last nights lotto win and only available to dealers.
If you find it let me know, I'd be most interested to have a look

Cheers
Ben

Hello all
Still looking in a low key kind of way for an 8528.
Remote control ideally but local is OK. Doesn't need to be programmed, I can do that, thanks to Ben's very useful site.
Don't need a working auto tune antenna, tho that would be nice..
Anyone selling one?
Cheers
Terry

There were some receive only models such as 7005, and the remote, rack mount, 1 ?module per channel?receiver (type No. ?)?. In W.A companies such as AES, the local Codan rep, sold Grangers prior to release of Codans, these were used by W.A. police and others.

Ron & Jim
Thanks for the info, Jim if you could email the pics, it would be appreciated.
Ron, I'm basically after a 'evolution' of codans as it where, a rough date would be fine, but mainly the order
they were released will do.I would assume, they are basically numerical order??

many thanx
Ben

Hi all,
most of you are aware of the badtrans virus by now,
Dont open any emails from Kim Piper (sorry Kim) they are infected.
The virus monitors keystrokes and sends them to a remote server
i.e. grabs passwords.
I suggest everyone update their virus software. This virus is only a week old.

Ben,

I could be wrong but I thought that the first two digits where the year of orginal design. For example 7727 where fist design in 77 and 8525/28 where first designed in 85 etc etc.

Lobo,
I think you are right there on that.
I believe the 8525 was released in 85, the 8528 in 88 and the 9323 in '93

Have come across the whip bases (Terlin type) at about 1/2 price new.
Also new springs for less than 1/2 price.
If anyone is interested email me.

Cheers

Jim (no affiliation, no kickbacks yabba yabba)

Have had several emails re the actual whips. People seem to need RFDS
+ 737 whip aerials. My experience is that at the moment
the "Survivor" type whips are as scarce as rocking horse proverbial.
Especially s/h (at a reasonable price I guess). Yes I know that old
whips can be tapped but waterproofing and reasonable looks are issues.
Tell me I'm wrong .....someone.....please :)))
Cheers
Jim

Jim,

I have re tapped several antennas and they look OK. You need to buy
some heatshrink with glue inside.
This is how I have done it.

tap antenna at right location for good vswr.
Solder bannana plug on with little fly lead.
Arlidite plug to antenna.
Place heatshrink over and shrink down.
I also have painted the antenna matt black.

It looks ok and has lasted a for several years on my 4wd with no
problems inlcuding no water ingress.

Lobo

Any way you probaly have done it similar yourself.

Lobo, thanks for tips. I've more or less done the same but have a couple of questions. I used a WMC Terlin aerial and tapped etc. The araldite didn't want to stay glued...bad batch or doesnt araldite glue to araldite on aerial.
Heat shrink...there is a trick here. The aerial is tapered and many taps so how does one select size and get it down past other taps ? Also as the aerial plus tap makes a strange bulge, does the shrink weatherproof it ok.?
Cheers
Jim

167. Fw: New virus warning

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2001-12-07 06:56:37 UTC
From: Ben Hobson
Topic: 167 Message: 167

Win32/Goner.A.Worm
Win32/Goner.A.Worm

Computer Associates International, Inc.
December 04, 2001

Also known as W32.Goner.A@mm

For more information, and to download a utility that will recover system settings changed by Goner.A, please visit the Goner.A description in our Virus Encyclopedia.
The worm attaches itself to an email with the subject line "Hi", and attachment name "gone.scr". The message body reads:

How are you ?
When I saw this screen saver, I immediately thought about you
I am in a harry, I promise you will love it!

Once activated, the worm displays a message box about its origin.

pentagone

coded by: suid

tested by: ThE_SKuLL and |satan|

greetings to: traceWar, k9-unit, stef16,^Reno

greetings also to nonick2 out there where ever you are.

Later the worm displays the following error message:

Error While Analyze DirectX!

The worm searches for the following processes in memory:

APLICA32.EXE
ZONEALARM.EXE
ESAFE.EXE
APLICA32.EXE
CFIADMIN.EXE
CFIAUDIT.EXE
CFINET32.EXE
CFINET.EXE
IAMSERV.EXE
IAMAPP.EXE
PCFWallIcon.EXE
FRW.EXE
VSHWIN32.EXE

VSECOMR.EXE
WEBSCANX.EXE
AVCONSOL.EXE
VSSTAT.EXE
NAVAPW32.EXE
NAVW32.EXE
_AVP32.EXE
_AVPCC.EXE
_AVPM.EXE
AVP32.EXE
AVPCC.EXE
AVPM.EXE
AVP.EXE
LOCKDOWN2000.EXE
ICLOAD95.EXE
ICMON.EXE
ICSUPP95.EXE
ICLOADNT.EXE
ICSUPPNT.EXE
TDS2-98.EXE
TDS2-NT.EXE
SAFEWEB.EXE

Once found, the process is terminated. The worm then searches and deletes all files in the directory from which the target process was launched. If any files cannot be removed, Goner will note the file name(s) in WININIT.INI and automatically attempt to remove these files the next time your computer is restarted.?Goner also specifically targets the directory: "C:\Safeweb?and deletes all files from this folder.

The worm drops a copy of itself as "gone.scr" to the System directory, and modifies the registry to ensure it is run on Windows startup. The worm adds the value:

%System%\gone.scr

to the following registry key:

HKLM\SOFTWARE\MICROSOFT\WINDOWS\CURRENTVERSION\RUN

and sets the value data to:

?System%\gone.scr"

The worm also utilizes ICQ and sends itself to the Contact List users who are currently online. If the worm finds the mIRC folder, it creates the file remote32.ini and adds references to this file into the mirc.ini file. The code in the remote32.ini file is a zombie and may be used in a DoS attack.

Detection for this worm has been added to Computer Associates antivirus solutions. Install the latest relevant update to ensure protection.

Topic: 168 Message: 170

Sean,
the eproms for the 8525B and 8528 are the same, 27c512 but the 8525A is a different eprom. 27c256 (from a very foggy memory !!) However, the contents of these eproms differ greatly, you must get the profile that suits the radio.
I have an 8528 profile on my website for download at the moment. I also have 8525A and B profiles I can do up if you need it (or any one else for that matter) The Dick Smith kit works fine. The mod for the 27c512 is simply a switch. As Jim said, instructions included in the kit.

I'm replying to your enquiry you sent me from my website here, for the benefit of others

HI Stewart.
You dont go buying them from DSE. I just got hold of
some old ones from old vga cards or parts from 286/386/486 computer
motherboards. You only need to erase them and reprogram them. I have about
twenty or so lying around my shack here. Dont buy them , source them for
free other wise you pay about 10 dollars each, to much

Hi

Check out this website, they pay people for receiving SMS's on their mobiles and pay the people who referred them a commission as well.

The network (called DynamicSMS) charges advertisers for sending advertisements to their members. The examples on the website are that if you introduce 10 people who each introduce 10 people who each introduce 10 people, you can make $826.70 per month - not bad for introducing 10 people. If you introduce 30 people who introduce 20 people who introduce 10 people, you could be earning $4,893.70 per month or $58,724.70 per year !!!!

They also let you setup a lifestyle profile so that you receive ads best targetted to what you are interested in.

To find out more or to join, click on the link below which will take you directly to their website

URL : http://www.dynamicsms.com.au/intro.asp?ref=09173451300&refc=382

Payments are made electronically by direct deposit into any account you choose.

Best regards

---

176. Codan 8525 problem

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2001-12-16 01:59:22 UTC
From: astro3au
Topic: 176 Message: 176

Hello all, I was give an 8525a with remote head this radio does not power up and when I removed the cover an L.E.D was flashing and on the board it was labeled "LOCK 2". Does anyone have any ideas as to the problem.

Thanks Craig.

Craig,
this is an indication that the VCO is out of lock.
either
1) eprom with out of band freqs in it >18mhz for 8525A or wrong eprom.
2) No eprom fitted!
2)vco out of tune, or something failed in the VCO section.

If it doesn't power up, check the eprom is actually fitted.Its on the other side of the radio
to where you found the LED. Its more or less in the centre of the radio.

First of all, you'll have to get it to power up so you can select channels before you can begin to fix
the VCO problem.

cheers Ben

Hi Craig,
the LED indication is that VCO2 has lost lock & hence will
inhibit all the trancievers functions. The most likely cause is old
Cs in the VCO feedback circuit. This is a fairly common fault with
the earlier models & halfway through the 8525B model a newer design
VCO board was manufactured. I would start by replacing C147 1uF
capacitor.
Regards,
Rick

they are a computer, you cannot just pick on up and then configure it to how
you want, you need the manual and maybe evena alessson. If you like
exploring then you will conquer computers and therefore conquer the NGT,
they are not hard to use its how you set it up.
I can set up, up to 4 short cut or macro's for every number 1 -9 and then
you wouldn't be able to use it easily.

They are not hard to use once you have learned the menu.

There is only one road in Aust but you may have to take several turns to get
to the location you need.

Peter

I needed a HF and it was that or the Barrett, but I like the latest
technology and the codan seemed the best for me.
Cost wise they are about the same if you have to add a console for the
Barrett.

Gday.

Am, looking for someone who has been there and done that with the DICK SMITH kit eprom programmer, with mod. (trying to program an 8528) Just after the optimum settings for the eprom in the software, either software available from Glen Pure or David L Jones. Have Wasted a few chips so far being the 27c512. Seems to be many parameters to adjust.

many Thanks

195. Re: [codan_outback_radio] eprom programmer settings

Topic: 194 Message: 195

I have a DSE kit as a backup, I dont use it much as most of my work is done on the work eprom burner
however a few tips
find an old 486 or slower.
run it from dos, not windows
dont use a laptop, usually not enough volts out the lpt port to drive it
Settings will vary depending on brand of eprom but not much around your base setting
Go for the slowest possible burn time, its usually more reliable
I assume when you mean wasted chips, the info is corrupted, not the chip itself is stuffed?
use Glen pures software, after all he designed the thing, from;

http://www.tip.net.au/~glennpur/electron.htm

make sure the '512 mod is correct, the instructions in the kit are a bit vague..

If you want to make your own programming lead for the Codan 9323, get ready for the price Codan will slug you for the microphone plug. I just ordered one from the NSW distributor and they charged me $49 (delivered) just for the plug.
I couldn't believe how much it cost, but on the other hand they have the market cornered I haven't been able to find this plug anywhere else even trying places such as Farnell and RS components. If anyone does know of somewhere else (outside of Codan) that does stock these plugs please let the group know.

If you do want to make up your own programming lead or know of any Codan part numbers I have attatched an Excel sheet I have been making upwith the pin-outs and part numbers.

Brian.

Brian,
OUCH!!!
I haven't investigated it fully, but as you are only dealing with 2 data lines and earth, I thought you could wire a 2.5mm stereo socket in parallel with the appropriate pins inside the control head.
Would make for a cheap programming lead.

Anyone want to try this, I could publish details on my site???
The pinouts for programming cables for this series of transceiver are also in the XP user guide
(on my site)

mmm If only I had a 9323 to play with..... (hint hint)

Ben

From: t92pal
Topic: 199 Message: 199

Hi people,
I am looking for help about Codan 8528. I just got it, but it can not RX or TX any amteur frequencies. Even I have the manual for it as well as bunch of the Tuners for the car for it, I do not know is it possible to program it trough Front Panel (with jumpers) or not.

Is ther anyone so kind to help?

I would really like to set up the HF system but...even I have upgraded my HAM license to T95LPD (c class CEPT@)

Thanks in advance to all of you. 73 / 51 /59

The 8528 can be used as a free tuning receiver anywhere from 0 to 30mhz
select any channel, press any of the tune fast or slow buttons.
press ENTER, input the freq you wish to RX, press ENTER again.

to TX amateur freqs you need to either, pre program a number of select freqs
in the EPROM. You wont be able to do above 24mhz this way.
OR get hold of the option A eprom profile.

have a look at my website for further details

From: tristarasia
Topic: 209 Message: 209

Hi Folks,

I am new to this board and have just acquired a pristine 8528 and power supply. The radio is luckily fitted with the TXE option! I was wondering if anybody knows of any software which allows control of the radio via a PC or PIC controller or if anybody knows the "command set" used by the remote head to allow software to be written for this purpose. I read in some early postings that somebody was hoping to do this, but have been unable to find any recent postings on the subject.

Does anybody on the list use this radio for Amateur Band operations, I am hoping to be on air once I have received my local license.

Best Regards..... Richard Manson
Jakarta, Indonesia.

210. Telstra RDD Closing

Hi Group,

As you are all probably aware, the Telstra RDD and Radio Telephone Interconnect services will be closing on the 28th Feb.

Has anyone out there investigated the options for a replacement for this service? I am aware of the following ones:

RADTEL - have 3 bases around Aust. East, West and Central Aust.

Radiodata/Bushphone+ - have 5 bases icluding Perth, Alice Springs, Melbourne, Brisbane and Derby.

Prices are fairly similar and both have about 10 freqs to access the interconnects.

Anyone know any more about this or can reccommend alternative??

Mark

I have signed up & paid for the radiodata service.

I also use their VMS694 service. It is similar to, and on the same frequencies as, VKS737 but does not have the high pofile operator service or cost.

I have no use for the 'skeds' VKS737 run.

I use it for car to car communication & occasional base contact.

Regards,
Rick Hunter

Hi Mark

Someone mentioned VKS737. They offer the ability to make calls on an ad-hoc basis - I don't have any regular requirement to make RDD calls so I'm happy with that at this stage.

I gather that if I want to use one of the new services, I'll need to install additional frequencies in my 8528. I'd thought of taking it to the experts, who'll charge me $70 to add them to my eprom. I gather from reading the info on Ben's web-site that I can install the additional frequencies I need as transmit/receive P-channels, if I modify the radio to allow me to short across the pads in position 1 on the microprocessor link. Have I got that right? Has anyone tried this?

Chris

Chris,
when you do this 'mod' for P-channel addition. use a toggle switch
rather than a push button, This way you can throw the switch on your transceiver, which may be in the boot
of your vehicle, and then turn the radio on in programming mode.
It just saves needing extra long arms or a second person.

You can however just short the pad with a screwdriver etc and get someone else to turn the radio on, if you are only planning on adding channels on a one-off basis

BTW: I wouldnt mind $70 for a quick EPROM Burn!!!!

Cheers
Ben

Subject: [codan_outback_radio] Re: Telstra RDD Closing

Hi Mark

Someone mentioned VKS737. They offer the ability to make calls on an
ad-hoc basis - I don't have any regular requirement to make RDD calls
so I'm happy with that at this stage.

I gather that if I want to use one of the new services, I'll need to
install additional frequencies in my 8528. I'd thought of taking it
to the experts, who'll charge me $70 to add them to my eprom. I
gather from reading the info on Ben's web-site that I can install the
additional frequencies I need as transmit/receive P-channels, if I
modify the radio to allow me to short across the pads in position 1
on the microprocessor link. Have I got that right? Has anyone tried
this?

Chris

Rick,
Do either of these services provide direct dial from your transceiver,
or are they through an operator??

Hi Andrew,
VMS694 is $27.50 per year, Bushphone+ is $115 per year.
[and keep your current Telstra selcal number.]

I can't remember the call costs.
I will scan the brocure & forms & post them in the next day or two.

Regards,
Rick

Would be good to see some info on these services. Maybe web pages,
freq they use, services supplied etc. If anyone can scan something
I'd be very interested.
I'm a member of 737 but obviously they are not for everyone.
In terms of Radphone facilities I don't believe they see themselves
as a major player.

Cheers
Jim

224. Radphone...

Yahoo group: codan_outback_radio (1997 — 2004)

From: markeaust
Topic: 224 Message: 224

Thanks for the postings guys and sorry about the double up on the original post...not too sure what happened there..?

My main concern is coverage, rather than the price, seeing as there isn't much difference. I spend a lot of time in the mountains in VIC, but also travel into outback areas.

Radiodata has a base near Geelong which may or may not be useful in Vic as often the stations a little further away seem more reliable. I get St. Mary's base and Newcastle bases on VKS clearly during most of the day, but Adelaide is generally quite poor.

Rick, can you give me a bit of an idea on the coverage of the Radiodata network? Any other experiences on their coverage would be great.

By the way, if anyone needs to put in freqs in the 8528 or 9323 don't bother taking it to the dealer, just have a look at Ben's website as these methods are easy and free. I have a 9323 and can program freqs whenever needed!

Thanks again,

Mark

Both the Radiodata and Radtel are direct dial services but you can't dial into them from a PSTN service...you have to ring the shop, leave a message and then they send a message to the radio to call a particular number. I suppose they do this to make more money out of the calls!!! I thinks on the 9323 they send you a 'Page Call' with the number to ring.

To my knowlege these are the freqs:
Bushphone 4813, 7797, 9992, 10490, 13790, 3882, 5280, 12150, 14971.
..(?VOA coming through strongly on 13790)

Radtel 3760, 5105, 5744, 6910, 8083, 8160, 11487, 12211.5, 15968.

Have listened a bit, but channels very quiet, so it's hard to judge performance.

Wonder if they would mind a short trial to compare????

Mark

Mark
had a quick look.
Couple of things.
Without going into the bullbar/antenna arguement. If you can lift your antenna
up to the top of the bar it would be better. It will work where it is as the top half of
the base
is above the groundplane (bonnet) but will be improved up higher.
It looks [?] like you have no tape on your antenna connectors. Tape them up with
some rubber vulcanising tape to waterproof them.
Otherwise looks good.
Perhaps more members may wish to put up similar photos???????

Ben

Thanks for the feedback on the P-Channels mod.

My set has the 27 meg CB Channels fitted as channels 9901 - 9940 (options LU). The info on Ben's site talks about the need to reduce output power to prevent damage to the PA (power amplifier?) when transmitting in the higher frequencies. How can I tell if this has already been done? The mod described in Ben's site has not been done. Is there another way to reduce the power, which might have been done?

Chris

237. 8528 - failing to tune

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-02-16 03:40:48 UTC
From: chrisnicholls2002
Topic: 237 Message: 237

Hi

Well, the installation of the additional TX/Rx P-Channels worked ok - I've now got the extra channels sitting there ready for the Bushphone or Radtel service. However, I've now got a problem in that the radio won't tune up the auto-tune antenna.

I can't say that the problem is related to the P-Channel mod. The last time I used the radio was a fortnight ago, and on the last over the radio bleeped the "not tuned" sound at me. I assumed it was because of where I'd parked the vehicle, on a side-slope. I didn't check it before I installed the new Tx/Rx P-Channels.

When I press the Tune button I can hear the stepper-motor working, and the radio makes the pips as it tunes the aerial. The cables all appear sound. When I select to a Receive-only channel, and press the Tune button, the reception improves. I checked the ribbon-cable connector that runs from the back of the set to the board - it is plugged in ok.

I've removed the Link-2 bridge that I installed to enable the P-Channel programming - no difference.

Is there a simple test for whether the problem is in the 9350 auto-tune antenna or whether it is in the radio? Thanks

Chris

Jim,

I think you misinterpreted this. It just means that if
the 'home'station on their PSTN phone wish to contact the mobile,
they cannot do so directly, as they could with the old RDD system.
These new mobs arrange a system where the home station calls a
particular number and leaves a message contating the mobiles selcall
number, names and return telephone number. The RADTEL/BUSHPHONE
providers then pass a message on to the mobile to contact that
particular number...via a selcall to the mobile or a "page call" if
the radio is capable.

With the old RDD system, the telephone user was able to dial directly
into the interconnect unit and try selcalling the radio and gaining
contact immediately. The only costs involved in this was the STD
call to the interconnect unit and no charge for the mobile. This new
system will not allow this. Every contact will involve a call FROM
the mobile, which will attract their higher call rates...hence more
profit for the companies...good business sense I suppose!! No good
to us all if they go bust!!!

Hope this makes sense,

Mark

239. RDD Decision....Instal photos...

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-02-16 05:22:22 UTC
From: markeaust
Topic: 239 Message: 239

Thanks everyone who posted.

I've decided to go with Radiodata/Bushphone for the following reasons:

1. More bases spread evenly around Australia, which should ensure grater coverage whereever I go.

2. Frequencies are specifically Radiotelephone only, which will ensure minimal interference and hopefully less "competition" for air time.

3. The guy on the phone was very helpful and gave me the freqs and beacon selcall numbers and locations of the various bases, as well as an updated EEPROM image for the 9323. (I must get around to making a programming lead...now that I have the software. Will use a mic plug piggy backed to the wires in the fancy Codan mic and fitted in the back of the mic, out of sight.).

4. Reasonable price for the service they offer, particularly if you only want intermittent access...ie half price for any 120 days in 3 blocks spread over a year.

All sounds pretty good to me!!

Re: My installation:

1. Have had the antenna up on the bullbar before and it was distracting for the last girlfriend, so I moved it...more fool me. Hmmm, better move it again before the new girlfriend gets used to it where it is!!!

2. I usually tape the plugs up, but had the antenna off for a little while and haven't got round to taping them up again, just lazy.

3. Have a little toggle switch on the back of the set for gaining access to the TPE link for programming...was getting sick of removing the cover...just a note here...I used to have an 8528 and when I fitted a similar switch it created some type of strange 'feedback'through the speaker during selcalling. The 9323 does not have the same problem. Anyone else experienced this?

4. Rear parcel shelf installation has been great. Not one additional hole drilled in the car. The shelf bolted to the seatbelt bolts and the kiddy restraints at the back. Very strong, no rattles and provides some additional storeage space for very light items like rain coats, blankets etc....don't want anything heavy up there not bolted down for fear of them hitting me on the back of the scone in a bingle!!!

5. Remote head...have had this in a number of spots but have setgtled for the dashboard. Good balance between access, vision etc..only worry is the continual sun beating down on it...any suggestions here or has anyone had any problems witgh sun damage?

Hope to see a few other instals on here...

Cheers,

Mark

ps Anyone got any interesting 'listening' HF freqs to share? I will post a couple of mine in the future...

Chris, maybe the ant driver board. Its the little one next to the
eprom board from memory,and has 4 power transistors mounted in a row.
Its also connected to the aerial remote.
Take the cover off, give the radio a good session at trying to tune,
then CAREFULLY put a finger on each of the power transistors. Chances
are one of em will be hot enough to burn your fingers. If so it needs
replacing.
Let us know how you get on.
Cheers
Jim

Mark, apologies. You are quite correct I posted when I should of read
it again :)
Having never made a bush phone call in *quite* a few years travelling
around, it's all new to me.
Seems to me I went bush to get away from the phone :))

Cheers

Jim

Need a bit of help here! Where's the Ant driver board you describe - can't locate it on my set. Picture attached.

The ribbon cable on the left comes from the antenna control, and plugs into P201 on the main board. I think the board in the centre is the microprocessor board - it has the eprom. The board on the right has the controls for setting selcal self ident and called address.

Also looking for the fuse on the PA as suggested in Ben's info on the auto-tune antennas. Can't find it either!

Chris

chris, you & I are in the same boat. Fancy autotune aerial & no option board fitted to control it.

I'm still looking for a option "AD" board that needs a new home in Auckland

no room for the 8551 interface.

cheers
Neil ZL1WBZ

Chris, which model autotune are you using? The 8558 uses an AD board but the later one apparently has all of the driver components in the autotune itself. For the later series disregard my post.
Cheers

Topic: 247 Message: 247

Ok so now I'm a bit confused. I have the info on Bushphone (thanks). The unbreakable network? Ever heard of sunspots? I also have info on the Radtel network recommended by the 737 network. No info on the VM mob. Are there more out there I don'tknow about?
The 737 lot are deliciously vague about their phone connect service....some base stations etc. If they have spare numbers on their interconnects etc. Have emailed em several times with requests for more specifics but no reply. Glad I wasn't wanting to join ! (I'm a member).
The Radtel lot need a later Codan series for phone calls. Too bad if someone has a 8525. I was told that Telecom used to have a direct dial microphone...white thing with pushbuttons on the back....anyone know anything ? Used to work with the Codan 8525 I'm told.
There's a heck of a lot of eprom reprogramming needed by the looks of it. Don't tell me I'm going to have to actually buy an eprom programmer :))
And while I love autotunes to death, when they stop tuning out comes the old reliable whip aerial. Ah.. need to put more taps on it for the new services. But which freq will we need? Can't put em all on...no room so what main freq will we need ?
Speaking of whips anyone got a decent way of making the end product look reasonable? Heatshrink would be the go but gotta get it past the taps on a tapered rod. Epoxy is good but need many layers if redoing say a Terlin one. I find glassing very messy and difficult (must be age).
Thanks for the confusion, Mr Telstra.(Let the market sort itself out...speaking of which ...how many phone calls do these services handle? Must be a small market)
Beginning to feel like I'm at the Mad Hatters Tea Party :))
Apologies for rant and rave...maybe more sleep would be good.

Cheers
Jim

Thanks - yep - I've got the 9350 antenna with all the works inside.

I double-checked all the cables this morning - all is well in that department. Then put the radio back in the car for another test - and it tuned up! Then, as I tried tuning more channels, and the set warmed up, it failed to tune. I guess something's getting hot inside and out of whack.

Hmmm. Off to the experts on Monday, I think.

Chris & All,

You are correct with the ID of the selcall and Micro board.
The PA fuse is in the PA section (cut off at the top of your picture). It is near where the DC lead comes into the set. It is a fine piece of fuse wire mounted between two posts there will be two other fuses near here also. They should be labelled.
One of these fuses, may or may not be in place, it is for external accessories power via the 4 pin plug on the back. If blown I just replace with a single strand of fine multicore wire

to clarify things with antennas.
Older 8558 Antenna (cylindrical base, connectors opposite each other) requires either OPTION AD board
Or 8551 external tuning box

Newer (1993 on) 9350 Antenna (conical shaped base, conectors on top of each other) requires neither of these add ons. If they are fitted to the transceiver it will not work.

If your 9350 antenna will not tune and the set is putting out RF power, check the coax, control lead
for continuity.
All else fails, the antenna is at fault

There are detailed instructions on dissassembly of both types of antenna on my website.

Be warned however, Codan will try to tell you that the 9350 is a sealed unit and has to be sent to them
for repair. I have pulled apart about a dozen and repaired them all with the exception of one.
The choice, in the end is up to you. $300 to $500 for a Codan fix , or the chance you can do it yourself

Hope this helps

Chris.
Do you have access to a RF power meter. This would be real handy here.
My bet is a dry joint in the PA or faulty power transistors.
Obviously it is putting out power when cold, but possibly not when warm?
I take it you are not getting an 'Unloc error'

Could also try removing the PA (sh!t job) and reapplying heatsink to the PA transistors etc.

Is this tuning problem freq specific or just heat related. i.e if you go back to the first channel will it tune that?

Ben

Andrew, good point which particularly applied to the older 8558 antennas The 9350 is a LOT more forgiving. Ben ----- Original Message ----- From: andrew lukies To: Sent: Sunday, February 17, 2002 4:53 PM Subject: Re: [codan_outback_radio] Re: 8528 - failing to tune - the latest Hi guys Forgive me if im off track, but is this a new installation?(is the set earthed properly?) Ben and others Thanks for the comments and advice so far. No - not a new installation - has been in the car for about 8 months; up to Cape York and back, etc. Worked Perth from north of Cairns last winter, when my mate headed west instead of north. Found the PA fuses eventually - I was expecting to see glass fuses - plain wire I was not expecting! There are two - both ok. I think it's heat-related: in this morning's test, it tuned up the first 6 or 8 frequencies I tried, then failed. When I returned to the first frequency (8022) that had tuned ok, it then failed to tune. Wouldn't tune anything after that. No "unloc" messages. No access to an RF power meter - so I think I'll have to take it to the friendly experts. Chris --- In codan_outback_radio@y..., "hz180" wrote: > Except when kissed by straying wildlife ? heheheh

Following Mark's lead, I've added some photos of my setup. The Nissan Patrol is well suited - there's a good spot behind the gear shift for the control head, and the antenna fits above and behind the bull-bar. And best of all - my wonderful wife doesn't complain about it!

Chris

Chris, think you have hit nail on head, although after a CY trip
anything could have vibrated loose, earth straps (dental work:) etc.
Your friendly experts should check the Rf output on tune fail, to
determine if its the aerial or set (as Ben indicated.)
This could easily be done with a cheap CB swr meter.
Yes the sight of the Codan fuses is a shock at first. Luckily they
don't seem to blow too often, and even then its often a matter of
operator abuse.
Cheers
Jim

How was the Nissans dust sealing on the CY trip ? On my last trip to
the Cape I spoke to several owners who were disgruntled. Maybe Nissan
has fixed it by now ?

cheers
Jim

Jim

It would be too mean to say "terrible" but it's not great. The ventilation system is the most annoying. It's funny to watch the passenger's face when I switch the blower fan on full after a day on dirt tracks - the cabin fills with dust!

It's not too bad if I'm in front, which is usually the case.

Mind you, the rest of the car is so good, I'm prepared to put up with a little bit of dust! Maybe the new models are better. (end of Nissan advert).

I guess the dust doesnt do the 8528 any good either, although they
seem to seal pretty well.
My series 60 L/C wasn't too good up there, neither was the Padjero
(although my d head bro kept putting the window down for fresh
air...in the middle of bulldust patches)
Also had a HF radio (Ham) actually fall to pieces up there. (French
Track to The Roads)
Current series 80 is brilliant in the dust dpt. Absolutely none at
all with the a/c on. From the Cape across the Great Central Road
hardly a sign.
Plus the landing deck on the front makes a great ground plane :))
Talking to a detailing guy.. said a Strangerover back from Simpson
had more red dirt inside than outside. I guess some need HF more than
others :))
Enough of my car yak...I can feel Ben becoming annoyed :))
Cheers
Jim

Mark,
Wonder how pedestrian safe that mount is...loosk liek it protrudes direct off teh front of the bar.

Personally I don't care about the pedestrian unless its me, but it may leave you liable civilly if someone is disfigures by the protruding metal, and I bet the insurers wouldn't be wearing it either.
Craig

G'day Chris, don't bother looking for the board. If you are running the 9350 antenna, you don't need the Antenna driver board on an 8528 tranceiver, you only need it for the 8558 antenna (Straight cylindrical tube bottom, not tapered like 9350.).

We hav a problem that is starting to appear more often with the fleet of 9350 antenna's fitted to a large fleet (Gov :-) .) of 9323 radio's here in FNQ and in other areas in QLD. It is with the antenna itself! Also seems to be mainly "B" series 9350's.

When the Tune button Is pressed you can hear the stepper-motor working and the radio makes the pips as it tunes the aerial.
The problem is caused by the failure of a small piece of rubber hose that acts as a dielectric join between the stepper motor and the tuning rod running up the centre of the tuning shaft. The rubber gets loose, slips and therefore no turning of the shaft holding the tuning slug/coil shorter. We use a piece of rubber fuel hose (It took a while to find a bit the exact size and dielectric property!) to replace the old piece, just make sure the 2 rods don't get close together otherwise, POOF! smoke, sparks and dead antenna again!
If you aren't too technical, most MAJOR Codan dealers are aware of the problem and can fix it, don't know the charges though. Maybe Ben has some comments on the subject.

Regards,
Sam.

Craig,

I hear what you're saying and whilst part of me agrees, I must tell you that thisa idea came to me when I saw a Codan installation on a Victoria Police Troop Carrier!!! I must get a photo of it for evidence one day!!!...just in case.

I will however be moving it up onto the bullbar again for better propagation.

Mark

265. RE: [codan_outback_radio] RDD Decision....Instal photos...

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-02-18 01:02:51 UTC
From: Brian Lea
Topic: 239 Message: 265

I just had a look at the photos.

Mark the set up looks good. Radio is in a great spot to see it and what is going on up front at the same time. The shelf is good too. I had something similar in my GQ when I had it. Sold it with the shelf and the new owner thinks its the greatest thing since sliced bread. I had the shelf in the GQ so it was just above the level of the windows in the rear section of the car, it had all of my radio equipment on it (after I drowned the car while the radio were on the floor) To get around the weight issue I ended up installing the shelf by making up a couple of angle brackets and using the mountings for Milford cargo barriers to bolt into. Bullet proof.
On the back og the GQ Patrol I had the tuner mounted on a bracket I had manufatured to fit in between the spare tyre and the rear door of the car. I still have the bracket and will post some photos as soon as I find them. If anyone is interested in the bracket for a GQ patrol e-mail me.

Brian.

Subject: [codan_outback_radio] RDD Decision....Instal photos...

Re: My installation:

1. Have had the antenna up on the bullbar before and it was distracting for the last girlfriend, so I moved it...more fool me. Hmmm, better move it again before the new girlfriend gets used to it where it is!!!

2. I usually tape the plugs up, but had the antenna off for a little while and haven't got round to taping them up again, just lazy.

3. Have a little toggle switch on the back of the set for gaining access to the TPE link for programming...was getting sick of removing the cover...just a note here...I used to have an 8528 and when I fitted a similar switch it created some type of strange 'feedback'through the speaker during selcalling. The 9323 does not have the same problem. Anyone else experienced this?

4. Rear parcel shelf installation has been great. Not one additional hole drilled in the car. The shelf bolted to the seatbelt bolts and the kiddy restraints at the back. Very strong, no rattles and provides some additional storeage space for very light items like rain coats, blankets etc....don't want anything heavy up there not bolted down for fear of them hitting me on the back of the scone in a

bingle!!!

5. Remote head...have had this in a number of spots but have setgtled for the dashboard. Good balance between access, vision etc..only worry is the continual sun beating down on it...any suggestions here or has anyone had any problems witgh sun damage?

Hope to see a few other instals on here...

Cheers,

Mark

ps Anyone got any interesting 'listening' HF freqs to share? I will post a couple of mine in the future...

Mark, mine is on the front bullbar, mounted behind the protusion of
the bar. I like to see what it's about to hit!
Having said that, I am not happy with this arrangement for the
reasons Craig has outlined.
Many 4wders mount them to the rear and appear to suffer few side
effects(broken bits at servos, forgetting to take off whip before
entering carport etc).
Unfortunately my l/c didnt come with a rear wheel carrier:(and I'm
not going to buy one just to mount an aerial.
Cheers
Jim

Brian,

Thanks for the comments. I think I will make a little 'shade' for the remote head to counter the worst of the effects of the sun beating down on the thing - should help with LCD problems as Ben suggested.

As for the rear shelf, I had seen one of these in a different car and adapted this idea for the Disco. It helps to utilise that silly wasted space in the roof area where the 'Alpine windows' are. It is also useful for other stuff like the CD stacker and rain coats, blankets, spare 'soft' bits and peices. I have also decided to fabricate a cargo barrier to go between the bottom of the shelf and the false floor...better for weekend trips with back seat passengers. Ooops...little off topic here..

Would be intereste to see some photos of your setup if you can find them.

Cheers,

Mark

Jim,

I hear what you're saying about getting away from the phone. For many years, I ran an outdoor education program for a school in Gippsland where I spent about 200 nights per year out in the bush and had the responsibility of other peoples kids in some pretty remote places. The ability to have reliable comms was vital, but it wasn't for parents to be able to ring me, just me to contact the school, emergency services and the odd call to my girlfriend.

These days I just like the availability of the best service I can get. I can turn the set off when I need peace.
It's also handy up around the farm in Benambra!

Cheers,

Mark

I have found the photo at http://auspol.topcities.com/cookBosnian.jpg The antenna is out in front (where it should not be). I have a copy of the rules of mounting things on bull bars and it IS a defect to mount them forward of the bar. Personally I have mine mounted behind the vehicle as I hate having the tuner on the front. I was very careful to mount the tuner on the rear of the car so when the whip is off the tuner does not protude above the roof line.

Craig,

I hear what you're saying and whilst part of me agrees, I must tell you that thisa idea came to me when I saw a Codan installation on a Victoria Police Troop Carrier!!! I must get a photo of it for evidence one day!!!...just in case.

I will however be moving it up onto the bullbar again for better propagation.

Mark

Jim,

I also had a laugh when I saw the unbreakable network ad. Gotta be kidding!

I gather that VKS 737 are only supporting the Radtel network due to the fact that the Bushphone network is affiliated with the "opposition" VMS network who they seem to hate with a passion...on their private frequencies etc... From what I can see the Bushphone+ network is much more complete and has the potential to provide greater coverage than Radtel...and for other reasons previously posted. I also can't be bothered with single number access only and the need to have to share my telephone call with potentially a few hundred people listening on the VKS freqs...forget it! I thinks they have over 4000 members now!

In relation to the fancy microphones, they are called are Jenal Selcall microphone and cost about $500. I believe they can be fitted to just about any HF radio to allow the Direct Dial access. The VKS network regularly mention them in newsletters etc...

Antennas: have had the same issues with new freqs and tapped whip whip antennas. It's a pain! Maybe the best solution is in a proper antenna tuner (?Smartune/ICOM etc) and a basic stainless whip?? 9350 seems like a reasonable compromise, but I reckon you need some type of emergency antenna when travelling.

happy sleeping,

Mark

Thanks Brian,

Points noted. Just a a matter of interest are those 'rules' Australia-wide or state-specific?

One problem I do have, is that to mount it behind the bar I would have to move the whole bar forward as there is insufficient clearance, no matter which way I do it. The only way I can mount it, even to the top bar, is to weld a bracket pointing forwards as well.

I may investigate the option of rear mounting, but I've always been reluctant to mount too much weight on the rear door due to the extra load on the hinges and the strength of teh crappy steel that the wheel carrier is made from (All the wheel mounting studs have had to be re-welded). Also mounting the black secton of the antenna below any surrounding metal surfaces (such as at the back of the car) reduces the 'ground plane' effect on radiation and reduces the effectiveness of propagation.

I don't know the answer to this other than to say that a reasonable compromise needs to be found.....further suggestions anyone???

Cheers,

Mark

Mark, thanks for the info. The mics I was referring to were pre Jenai and used by Telstra. I must chase the info up. Dunno what mods were necessary.
That 9350 freq is interesting. I take it that it is a major freq with Bushcom? Voice or just phone?
Cheers
Jim
Re rivalries between networks, a pity really. Are Bushphone affiliated with the VMS mob? Interesting.
I would probably make more boring phonecalls than you :) I dont mind who hears me. Of course I wouldn't trade shares over that phone connection.
Aerials are a PITA. The average user probably couldnt use an ATU properly without training. They just want plug and play.

Mark (and the rest of the group)

I have uploaded the bullbar guidelines. They are from the NSW RTA but I doubt they differ much from other states, you may like to ask at your local roads authority. It does make sense however not to mount anything forward. As for the position of the antenna I can't see that the tuner actually acts as any sort of a groundplane for the antenna. As far as I can see it is just a unit to measure VSWR and tune the antenna for a good match, so as long as the actual radiating part of the antenna is above the roof line it shouldnt matter too much. I can't see a good ground plane no matter where a HF antenna is placed on a car.

Brian.

Jim,

Ages ago, I got a box of old Phillips 92's and assoc junk. In that box was a Phillips 'box' with a keypad. It appeared as though it was a DTMF dialling facility for UHF Telstra freqs.....did they also have something similar for HF?

The freq should have been 9360, which is a Bushphone freq for phone only, as far as I'm aware.

Re; Rivalries...I have been amember of VKS since the network started, and before that I had the same freqs as VKS, as these were affiliated with Phillip Collins and Assoc. in Sydney who used to do all the HF work for a company I worked for at the time. He then passed these over to the VKS network, with the exception of the 2mHz freq.

When the VKS network started there were only a handful of users and they had just about exclusive use of the freqs. With the popularisation of the HF sets the user base began to grow and a couple of other similar organisations sprouted (ie HF Radio Club, Caravanners Assoc. freqs etc) VMS then started up and was allocated the same freqs as VKS by the ACA. VKS were not amused and wrote several letters to the ACA complaining that VMS users were interfering with their 'skeds' and continually sending selcalls over other users, in addition to allocating selcall numbers that would trigger various dialling numbers on their interconnects etc...thus the rivalry. Seems a bit like a typical ACA stuff-up to me!

I doubt that your phone calls are more boring than mine, I just don't like the idea of the potential interference...selcall tones being sent over the top, people talking over the top etc...I see these freqs as heading toward CB status if they keep growing at the rate they have over the past couple of years. Consequently, I need something a bit 'quieter' for phone calls!

Cheers,

Mark...with only 7/10 of left index finger...the other bit went in the bin after cutting the vegies the other night....ouch!! Typing not the eeesiest!

Mark, the perils of being a new age man. Cutting, cooking and
probably eating vegies. Isn't that why God created camp food :))
I suspect that the mics are very similar. A friend who used to work
in the field told me about them but now I'm chasing details.
Appreciate the need for quiet channel with phone call. Years ago I
was using public phone in Birdsville. Had to spell message
phonetically because of others on the chan!
As for rivalries, I can see the problem. I am still wondering just
how lucrative this market is. Seems to me the number of phone calls
must be in the thousands for these groups to pay it so much
attention. Personally I would have guessed hundreds maybe.
Phillip Collins etc eh? Don't happen to be a whiz on their Radphone
interconnects ?
Cheers

Brian,
Thanks for the info. Looks like of got a little thinking to do re the position of the Ant.! Seems like we all have to do things safely except the police/SES etc.....not an excuse, just an observation!

I do remember reading in the mounting instructions from Codan that it was important to have sufficient space between surrounding metal work and the top 200-300mm or so of the base section of the antenna for tuning efficiency. Can't put my finger on the book at the moment to say exactly why.....perhaps Ben could help here.

Do others have different positions for antennas..How do others find them on the back?

Looking for a solution....new bullbar, maybe?

Jim,

Agreed! I have been a HF user for many years and even on the Telstra networks there were not THAT many phonecalls from Land Mobiles. There system was put in place for ships at sea. I wonder how many phone calls these new mobs will be handling and how it could possibly pay enough to cover the high overheads of HF gear, interconnects in half a dozen, or more, places around Australia, staff and all the maintenance etc....??

Can't help you with the interconnects, I'm afraid.

The finger is a hard way of getting a couple of extra days off work! Am learning to type with only 9 fingers.....or was that more than 2?

Mark, in my years of wandering I had always assumed that the
phonecalls were on another frequency because I also heard little
phone traffic.
Of course with the explosion of people wandering the outback I guess
not everyone has a satphone when they want to phone home. Maybe the
networks are planning for the future. My research shows that
a "modest" investment will get you into competition with the big boys
in this area. But getting enough traffic to make it worthwhile is
another problem. Anyway enough off topic from me.
Anything more please feel free to email me direct at
jimshire@...
Cheers

Hi group,

With all this extra time (not skin though)on my hands, thought I might just throw this at you to see what others think.....

How many of us actually comply with any of these, um, ...rules...???

http://www.vicroads.vic.gov.au/road_safe/safe_first/vsi/vsi29/vsi29.htm

(Sorry not too sure if this set as 'link'..)

It looks as though all of us with Codan antennas on the front are in breach of the "rules"!?

Oh no...

Mark

280. Antennas on Bullbars 2

Have added some closer shots of the antenna/bullbar.....

Hardly a danger to pedestrians but obviously "illegal"...

G'day Chris, don't bother looking for the board. If you are running the
9350 antenna, you don't need the Antenna driver board
on an 8528 tranceiver, you only need it for the 8558 antenna (Straight
cylindrical tube bottom, not tapered like 9350.).

We hav a problem that is starting to appear more often with the fleet of
9350 antenna's fitted to a large fleet (Gov :-) .) of 9323 radio's here
in FNQ and in other areas in QLD. It is with the antenna itself! Also
seems to be mainly "B" series 9350's.

When the Tune button Is pressed you can hear the stepper-motor working
and the radio makes the pips as it tunes the aerial.
The problem is caused by the failure of a small piece of rubber hose
that acts as a dielectric join between the stepper motor
and the tuning rod running up the centre of the tuning shaft. The rubber
gets loose, slips and therefore no turning of the shaft holding the
tuning slug/coil shorter. We use a piece of rubber fuel hose (It took a
while to find a bit the exact size and dielectric
property!) to replace the old piece, just make sure the 2 rods don't get
close together otherwise, POOF! smoke, sparks and dead antenna again!
If you aren't too technical, most MAJOR Codan dealers are aware of
the problem and can fix it, don't know the charges though. Maybe Ben has
some comments on the subject.

Regards,
Sam.

OK
my 2 bobs worth
Personally I think its all a bunch of B.S.
I honestly think if you have to the misfortune to collide with the front of a vehicle
at any sort of speed, you are up the proverbial creek anyway, bullbar or no bullbar.
bracket, or no bracket

I have had to deal with this issue at work as I have about 100 vehicles I look
after fitted with HF.

The way the rules are written is a very grey area.
Everyone you ask will tell you a different story except that
Emergency Service vehicles are exempt!
What they are basically trying to stop is sharp projections on the front of
vehicles.
This is why the new numberplate /spotlight mounting brackets have a curved tube on them
now.
(however these open up a new tin of worms re: number plate visibility.....)

Interpretation of this will depend on what the bloke in the uniform
chatting to you thinks at the time.....
I would try to make the bracket as rounded as possible without sharp edges.

Technically speaking, Codan went through this years back for the Government
of some country in Africa. They found that the best radiation pattern was with the antenna
mounted up high on the bullbar. With the antenna mounted on a bracket between the spare
wheel and the rear door, efficiency was reduced to around 20%. The only acceptable
mounting on the rear
of the vehicle was a bracket that held the antenna at least 30cm from the rear door.
Hardly practical.
I have seen antennas mounted through the bullbar tube itself, dont know what this does
to the overall strength of the bar.

Newer bullbars seem to be getting closer and closer to the bonnet all the time.

One idea I havent tried is an upside down 'L' shaped bracket facing rearward, mounted high
enough
to allow the antenna mounting bolt to clear the bar. The antenna bolt would be inline with
the centre of the
bullbar tube. Dont know how pretty it would look..

On my own vehicle, I remove my antenna completely when I'm not going on a trip
somewhere. Two reasons, prevent any extra attention (well it is a Falcon station wagon)
and the insurance mob wont cover it.

In summary, there is no easy solution to this except trying to educate the do-gooders....

Ben

*snip*
I do remember reading in the mounting instructions from Codan that it
was important to have sufficient space between surrounding metal work
and the top 200-300mm or so of the base section of the antenna for
tuning efficiency. Can't put my finger on the book at the moment to
say exactly why.....perhaps Ben could help here.
*snip*

The top 300mm of the antenna is where the tuning coils are located.
The bottom half is the motor etc..
```

Moderator, oh Moderator where are you.....

Further thought to the great debate. Nissan have told me in no uncertain
terms that mounting antennas on the rear wheel carrier will void any warranty
re: cracks in the door. The rear door for a new Patrol is around $3000

Thanks Ben,

I have to say I feel much the same way...colliding with anything at more than about 20kph won't really make a scrap of difference to the hitter or the hitee.

I'm more likely to move the thing for better radiation, more reliable tuning, and protection of the antenna itself...stuff the stupid rules.

I have had a variety of HF antennas on 4WD's since the early 1980's and have never been questioned about it....though someone asked me why I had a light pole on the front of my car!!!???

If we all followed every one of the silly little rules that "desk-bound pedants" get paid mega-bucks to dream up, we probably wouldn't be driving any car on the road, let alone with a radio installed!

Sam, Ben

Thanks for the guidance. The expert today suggested that the fault is probably in the antenna - we tried a new bit of coax, just in case it had been cooked, then tested with an RF power meter which tested ok. (And he didn't charge me for the opinion, either.)

I started out tonight to pull it apart, then got stopped by the hex-security screws. Off to the shop tomorrow to buy special tool number abc123!

Sam - can you spare me a piece of that special fuel hose? Cheers!

Chris

I may also have to do this with mine. Mine seems to tune OK most of the time and then at other times takes a few goes to tune up a particular freq. Sometimes if it won't tune to a particular freq, I re-tune it on another then re-try the original one and hey 'presto' it tunes up.

May pull it apart and check everything when I get the chance and the skin grows back on my finger.

Sam, would you please let us know what the particular piece of rubber tubing was....we be able to source it near to our homes..?

Thanks,

Mark

Date: 2002-02-19 07:20:36 UTC
From: ib_oz
Topic: 295 Message: 295

Hi all,

First post here. I'm located in Alice Springs and have an 8525B radio (waiting for an 8528 head....like everyone else :-). Been a member of VKS737 for a few years and help out running Alice Base.
Anyway, enough about me...

Tell me, is it possible to effectively add an AD board to an 8525A. Certainly it all seems possible except there is a flylead coming off the AD board that normally connects onto the PA(?) board up near the connectors..the problem is that the 8525A I'm playing with doesn't have this connector or any indication on the PCB etch. The connector is normally light brown in colour and has 2 pins.

BTW, There is another identical connector a few inches away, but I think it does something different.

Ian B

PS: Went and spoke to Codan dealer today and they told me they junked a dozen 8551's when they moved a few months ago...this was the alternative to using the AD board. Anyone got an 8551 for cheap?.

296. Web page up and going

OK people, I'll get the name and part number off the piece at work tomorrow
and
post it here. It was purchased from a hose and tubing shop, like "ENZED" but
will try to get the name as well, just in case.
We tried 5 hoses from different manufacturers in the same diameter but guess
what
! The diameters wern't the same nor was the amount of (Or supposed Lack of!.)

carbon (Conductivity) the same! Plent y of smelly smoke when testing.

Sam.

Sam

Well timed! I was just about to post and ask you for some more details of that bit of hose.

I've pulled the auto-tuner apart and found the bit of hose concerned. It's 29mm long, about 12mm outside diameter and about 5mm inside diameter. Mine is a pale/milky/clear appearance and feels a bit like a silicone rubber composition.

Now - you refer to it as forming a "dielectric" join between the stepper motor and the tuning rod. What does "dielectric" mean? I've put a meter on my bit of genuine Codan hose and it appears to be a perfect insulator - zero conductivity. In your notes you also mentioned that you have to keep the tuning rod from touching the motor shaft - which seems to tell me that I want zero conductivity between the two. Am I on the right track here?

Anyway - I had a look in my box of spares, and found a bit of Goss fuel hose, 7/32 inch inside diameter. This is perfect for the mechanical job of joining the two shafts - a nice snug fit. It also tests with zero conductivity. Should this work?

Chris

301. Barrett For Sale

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-02-22 03:58:54 UTC
From: Brian Lea
Topic: 301 Message: 301

Posting this for a friend all return email to Rob@... Thanks

Barret 550 with remote head. Grey Antenna (new style)
3-4 yrs old.

Called VIB Brisbane just before taking it out, so goes well.

Can ship anywhere in Aus

$Aus 2000 or Very Near Offer

All the standard channels inc VKs737 and RFDS. I think the actual capacity is up to 400 channels, and programming is either via a Barrett dealer,, or using the Dealer Software.

Barrett ship a standard Land pack with all the rad phone and everything else pre programmed, inc Pent Comstat (or firefly as they are known in Land Mobile) RFDS, VKS737, Telstra, and ITU

Cheers

Rob

Okay Chris and all, heres the gist of it.

The hose we ended up going to is the following

12mm (Approx.) OD Red outer sheathing with the following markings on the
hose.

"(6.3mm ID) 250 psi (1.72MPa) WP Nonconductive @1000V DC M09130 Z100"

As you can see it appears to have a "High" dielectric capacity denoted by the
"Nonconductive @1000V DC" marking.
The ends of the rods "MUST NOT TOUCH" and if you note the clearance of the
old hose and try to allow for the
same clearance with the new one.

That is correct, the hose acts as an insulator between the two and as a
"non-slipping"
flexible join as well.
What happens when the antenna problem pops up is the original hose starts to
"Slip"as
it expands or stretches with use.

Be careful, we tried thst first and found that "zero conductivity" tested
with a multimeter
isn't the same as "zero conductivity" tested with a high level of RF across
the joint or as
tested with a 1kv megger! Thats why the smoke!

Ian
The option AD did not arrive until the 8525B

I tried to fit AD to a 25A a while back. While the points in the PA are not obvious, looking at the circuits of a 25A & B , I added the appropriate caps and resistor needed to pick up the VSWR reference. The pins on the microboard are obvious. After all this , it did not work. I am assuming it is a firmware shortcoming.
The 8525A was not released with an autotune antenna. Due to demand/competition Codan designed the 8551 tuning box to drive the 8558 antenna, & the rest is history
So, your options are;
use a tapped whip antenna - there is a member on this group making/repairing them (speak up if you wish to be known)
find a 8551 box - good luck!!
do what I did and find all the appropriate boards and convert it to a 8525B/8528 (expensive)

----- Original Message -----

Hi all,

First post here. I'm located in Alice Springs and have an 8525B radio (waiting for an 8528 head....like everyone else :-). Been a member of VKS737 for a few years and help out running Alice Base.
Anyway, enough about me...

Tell me, is it possible to effectively add an AD board to an 8525A. Certainly it all seems possible except there is a flylead coming off the AD board that normally connects onto the PA(?) board up near the connectors..the problem is that the 8525A I'm playing with doesn't have this connector or any indication on the PCB etch. The connector is normally light brown in colour and has 2 pins.

BTW, There is another identical connector a few inches away, but I think it does something different.

Ian B

PS: Went and spoke to Codan dealer today and they told me they junked a dozen 8551's when they moved a few months ago...this was the alternative to using the AD board. Anyone got an 8551 for cheap?.

Ian, the Brisbane agents of Codan (Mobile 1 ?) had some old 8551's in the loft. They seemed keen to throw em out so not sure if they're still there.
Call Steve or Todd in workshop on 07 3373 2333.
Let me know how you get on. I may have other sources (hopefully).
Cheers
Jim

305. Bushcomm antennas?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-02-24 04:26:00 UTC
From: chrisnicholls2002
Topic: 305 Message: 305

Does anyone have any experience with Bushcomm antennas (http://www.bushcomm.com.au/aboutus.htm). I was thinking of getting one of their SWE-100 aerials as a backup for the next time the auto-tune antenna fails.

I've got it working again, by the way. I put the original bit of Codan rubber tubing (that couples the motor shaft with the worm drive rod) back in place, with a couple of very compact hose clamps to hold it in place. Seems fine now.

Chris

Chris, they make some good stuff. Unfortunately it's expensive. I used to sell a "quickie" emergency aerial suitable for the 737 network. With recent changes I was thinking of a wideband job similar to Bushcomm. This type of aerial does have some disadvantages. One of them is that in broadbanding one often loses gain. Even so in the event of an autotune failure having something instead of nothing can be a lifesaver.
The problem is of course that if I made something like the SWE100 then with costs and gst etc I probably wouldnt be able to make it worth my while.
Cheers

Jim

How hard is it to make one? In the pictures it looks a lot like the stainless wire I make fishing traces and rigs out of. I guess the secret is getting the lengths right. I'm not trying to do them out of a sale or pinch any one else's designs, but I hate paying for something I can make myself!

Chris I know where you're coming from. But frankly its as close to
that fishing wire as I am to being a millionaire.
For single frequencies yes its a matter of getting the length right
and getting the feed impedance right. And that can be as easy as
trying to convince the camels in front of you to get off the track.
As for wide band devices (a la Bushcomm),the secret is not only the
design and the lengths, but also the matching network (probably
hidden in a plastic box).
I am currently rehashing some Terlin aerials to do 737 network and
maybe a Bushcom freq. It's a pita I wouldnt wish on my worst enemy.
Every time you touch em it throws the rest of the frequencies
out.Without a decent aerial analyser (6-800$) it's a nightmare even
if you know what you're doing.
Cheers

Hmmm. Sounds like they could almost be worth the $250 odd that they
want for the SWE-100! I'll give them a ring.

Chris

HI Chris,
FYI from another group...

.....
Following may be of use to HF owners to make a cheap emergency antenna in
case of Autotune Damage:

Buy a PL259 plug (for Codan ☐ check other makes) and a reel of insulated
wire (any wire ☐ auto wire works well)

Measure the wire and put tape markers on the length for the frequencies that
you may need using formula:

234/frequency inMegahertz = length in feet
EG Broken Hill = 4.055 MHz
234/4.055 = 57.7 feet
To transmit on 4055 you need a length of 57.7 feet of wire.
After you have done this cut 6 inches off the radio end of the wire (this
makes allowance for the wire in the end of the reel that you have not
unwound) and connect the PL259 plug.
To use, unplug your antenna from the radio, plug in the emergency plug,
unwind the reel to the frequency marker that you need, (Roughly Horizontal,
raised above the ground is preferable), and operate the radio as normal. The
wire gets very hot during transmission, and the insulation may melt, so don'
t hold it while using it !

Regards
Richard Havard

.....

This method has a few disadvantages. Firstly your radio isn't going to like the spool of wire that's unused.(Especially those exe power transistors) Unless the car is earthed there is also the likelyhood of Rf burns(they hurt!). You may get RF feedback on some frequencies (garbling your audio). Depending upon how high and far away from other objects it is the VSWR may be high enough to be a problem.
If you MUST use this system it's far better to cut the wire to the required frequency upon use.
130ft of wire on the end of a tuner with an earth stake (earthing the chassis directly to the ground) should bring more reliable results without the possible dramas.
Having said all of the above, anything is better than nothing in an emergency.
Cheers
Jim

Chris,

I have one of these SWE-100's. When I got it I set it up in the front yard. It was elevated 5 feet at the far end, surrounded by trees, used a tent peg to earth the other end. I was amazed at how well it worked!. I've now decided to use it as fixed setup attached to the house instead of making a 'proper' dipole setup.

Given that, it is not what I use as a spare in case my autotune is non-operational. As a member of VKS737 I tend to use 8022 most of the time. Given that, I got a single freq whip made (A$140). I got it so it's lower than the roofrack of my truck and it now lives on the vehicle most of the time. I now only use the autotune when going on at least a full-day trip and take the whip off and put it inside. I figure this leaves me solutions in the event of a rollover/accident and solved the height issue of having an HF whip on all the time.

hth,

Ian B

314. GPS on 9323 and NGT

I have used what is called a G5RV antenna at Jamboree of the Air for the last ten years. It only comes out in October for that purpose but I have seen plans or have plans for a 52 foot long antenna . They do not require a tuner but will not work below 3.5 megs I think it is. It would cost less than $30:00 to make and lat for many years. Anybody interested

Graeme, if my memory serves me well the G5RV is great for amateur operation (although I could never get em to work properly :). However I suspect that they are not really a wide band device to suit the range of commercial frequencies that we deal with. Please correct me if I'm wrong as it would be any easy solution. Perhaps you could try one on the 737 and Bushcomm etc frequencies and post the results?
Cheers

Hi Everyone, Just found this site....

As a mater of interest I too have used a G5RV with Good Results.
But the best Emergency Antenna I have seen was owned buy a friend of
mine who buys a lot of army surplus stuff.
It was a dipole type antenna but the way it worked was a great idea.
It was made kinda like two retactable tape measures back to back,
one side connected to the "hot" centre wire of the COAX and the other
side hooked to the Braid.
All you had to do was pull each side out to the required freqency
(the "tapes where marked in frequencies rather than inches!!) and
string the centre part (the part that looked like the tape measures
to which the coax hooked up) up in a tree etc..This would form
an "Inverted V style antenna..... and transmit to your hearts
content.
The whole thing would colapse into the size of a salad sandwich.....
a great idea.

Cheers
John Harbor

Jim

Do you mean Bushcomm (aerials maker), or maybe Bushphone (provider of HF Radio Direct Dial telephone services)?

I received a Radtel (similar services) brochure with my VKS737 magazine, but nothing from Bushphone.

G'day group,

Another idea for bullbar mounting of antenna's

Only thing wrong with these is the angled reinforcement is not long enough, makes it hard to do up the nut on the antenna base

From: chrisnicholls2002
Topic: 332 Message: 332

Hi all

Can anyone give me some guidance on noise suppression?

I run an inverter in the 4wd to power the laptop (hooked up to the GPS for moving map display with OziExplorer). This produces a high-pitched whine through the HF set, especially on 8022, naturally the channel I use most frequently.

The power leads are separated, but run from the same battery.

Thanks

Chris

Hi,
Someone told me about this group and I am happy to have found it !

HELP

My company is buying me an NGT set which is going to replace the 8528 that I own. I have no idea what the 8528 is worth. I have checked the trading post and the only ad I found was asking $1,700 which surprised me as I didn't think they we worth that and others have told me that they are worth about $1,400.

Set is currently in my car (80 series) and in very good condition and working.

Below is ad I was going to place.

"CODAN 8528 HF SSB RFDS radio, 8533 remote head, direct dial telephone capability, all useful 4WD channels, auto tune antenna, manual, installed in vehicle working and good condition"

Can anyone give me an idea of what the value is (or what I should ask) for a quick sale ??

Thanks

G'day All,

Small world isn't it, some of you I know the others I will get to know, first thanks to Kimbo for telling me about this site, It's usually the other way around, but I have an excuse I have been away for couple months.

I live in WA, & get around the country a fair bit, the further out the better. I have a Codan 9323 & 9350 auto tune, Ive had it now for approx 3 years and been trouble free, apart from when it used to give me low batt warnings when ever I tried using it with engine not running, turned out it was not the battery fault but the Codan In line fuse was faulty and dropping the voltage, I swapped it over for a circuit breaker and has been perfect ever since. I use the Codan all the time when travelling and even when at home base I call up mates that I know or have met through travels or on VKS-737 network.

Anyhow thats me, I will help out where I can and lurk when I can't

cheers
Mick

344. PSTN Services

04 April 2002

There are two providers of telephone interconnect, Radtel (in NSW) and Radiodata (Bushphone+ in SA). There is also VKS 737 but their service is too limited for me (I am member, I am talking about PSTN) -

VKS 737 recommend Radtel.
Codan say either one, very similar

There are all sorts of stories and cross-accusations flying about.

Does anyone have any experience of either of these two providers ? I am having my Codan NGT fitted early next week and I don't want to have to go back and have another profile after the initial fitting. Seems you need a different profile for a different provider for this service.

Would be interested to hear any experiences with either, particularly about congestion and availability of frequencies, ability to get clear signal etc.

Thanks
Richard Havard

Richard there was some discussion on this list about this business.
Check in the archives. Also some listers have experience, I'm sure
they'll bob up.
Not sure about the ngt but why can't you just have all the
frequencies for 737, Radtel and Radiodata installed. That way you can
try and then make your own decisions. Can't be that expensive.
Cheers
Jim

I'm sure most Codan retailers will be very wary of installing any extra freq's in your radio. When I bought my 9323 at a place (who shall remain nameless) in Sydney I had to show proof of my VKS737 membership before they would program it in, and they even managed to stuff that right up because they had no idea how to program a radio. I ended up conning a Barrett dealer into reprogramming for free for me in return for a few favours (The world of buisness I suppose). Other companies in Sydney would reprogram the radio for me but at a cost of $80, Thats the reason you will want it done properly the first time.
As for Ratel and Radiodata I haven't dealt with either of them. A letter from Radio data arrived in my silent snail mail box which I didn't request from them. I have now worked out where the info came from (It wasn't VKS737 before people start pointing fingers there, they are not selling our details) I emailed Radio Data (with the email supplied on the brochure I got from them). 3 days later I got a return email to say my email had not reached them yet but my server would keep trying. A month and a half later they have still not bothered to return an email to me to advise where they got my details from. Great company (they will not get my buisness).

Just my 2 cents

Brian.

Brian, I was under the impression that his work was supplying the radio. They shouldn't have any problems.
I can understand wanting to see 737 membership first. But as I understand it anyone can buy a s/h rig if they want to be a pita on any freq. It isn't illegal to sell or own one, using it is another story.

I'm afraid that I was the one who suggested the source of our details that Radiodata got. The info was addressed exactly as it is recorded by the network, and that is the only mail addressed that way in my particular case. But if 737 didn't, I apologise publicly right here and now. I get really annoyed when any business supplies anyone with my details that I've supplied in good faith. REALLY annoyed. On the brighter side I feel much better now.
If I find out how they got my details I'll feel much worse I guess:(
Cheers

Couple of points:

I am already a member of VKS 737 and have been for a few years (R38 s/c 0212) so no problem there
According to both interconnect suppliers the "profile" needed in an NGT is different for their own services and one is not compatible with the other (maybe b/s but that's what they say) - It's nothing to do with the frequencies but to do with the "ease" that makes this set so simple to use for telephone calls.

What has whether or not who is supplying the new set got to do with what can/will/cannot/willnot be programmed ?? The Codan recommended dealer I bought the set from doesn't know my Company is paying, I am sure that if he had known at the time he might have been tempted not to give me the deal he finally did.

Talking to VKS 737 today, all members are going to get a letter shortly. They CLAIM that their mailing list was stolen, and asked us to consider that they would not be recommending one service whilst letting the other use their mailing list. They say it is all in the hands of their lawyers and asked me to pass this on if anyone made any further comments. They are very unappy with what happened.

Regards
Richard Havard

I was pointing out that whilst an individual might have problems
getting frequencies/profiles programmed by a dealer, a company would
most likely have no such problems.

Yes, radio can be set up with both, beauty of this NGT set though is that it can be set up to make a telephone call almost as easily as a mobile telephone, I have used HF for years, but my wife has never been able to handle and my hope is that she can get her head around this newer simpler system so need the "Profile" as well. I believe that it is something to do with auto selection of choice of frequencies and bases etc, but exactly how it works I won't know until I get the set, but there is no doubt that it is real easy to use for telephone and RFDS emergency connects.

I would hope that whether an individual or a company, a reputable supplier would only program frequencies that he was sure were legitimate !

Yes, VKS are very very unhappy. Long talk today to Adelaide and a very pissed off chap. Said that their mailing list was stolen, they are close to proof of this, and that their lawyers were now involved and that they expected a prosecution and conviction. (That's what they said, up to you to believe or not, but you have to pay the point that they wouldn't openly support one company while giving the other their mailing list !)

Guys,

Just thought I'd pop in my 2c worth...

Putting aside all the BS about who stole whose email lists and so on...

I went with Radiodata on the basis of the following:

They have a greater number of bases from which to choose.

The frequencies are (apparently) only used for radio telephone interconnect and therefore should be less busy.

They have a great spread of frequencies.

I found the bloke running the thing to be very helpful when I rang to make various enquires.

They have the capacity to 'split' your subscription into several smaller portions which can be used when going on a trip. (Though I chose the whole year option)

They allowed me to test the system before coughing up the money...beacon calls to bases only. I have been able to access Cowra, Melbourne, Brisbane and alice Springs from just outside Melbourne at various times of the day, even though I haven't been really active in trying...maybe this weekend on the way to the farm...

The whole setup just seemed a little bigger and better, though I wish they ran a kW or so like Telstra.!!!

I suppose I should be telling everyone it is crap so not too many people come on board....?

Hope this little snippet helps. Will report again after the weekend away in Gippsland.

Cheers,

Mark

ps. No affiliations or anything!

Mark, by "splitting your subscription" do you mean that one purchases
a whole year subscription and can use the time in blocks, or that you
can purchase say a 3 month subscription?
The latter would be of great value to those of us who can only get
away on big trips occasionally.
Cheers

Hi All,
I am a Bushphone+ (and Bush telegraph) user.
Both services are run by Radiodata P/L.

The PSTN service of Bushphone+ works well & I am quite satisified
with its' performance and coverage.

The VMS469 service is good for me as I don't need the 'skeds' etc but
more mobile to mobile communication across the country...but also has
base operators when required...it is also cheaper. (you get what you
need and pay for.

I have a suspiciob that there is a bit of agro between VKS & VMS.
Although providing a great service for those who need that kind of
thing, I think VKS are a bit precious after ACA allocated VMS the
same frequencies as the VKS non-exclusive frequencies.
Hence VKS would be unlikely to recommend Bushphone+.

Regards,
Rick

So VMS is the Bushphones Bush Telegraph...a service for mobile to
mobile?
737 tell me they have about 4000 on their books. I have heard few VMS
users on 8022. Is this because there aren't many or because they
prefer other frequencies?
Cheers

VKS-737 are talking about Radiodata stealing a list of contacts and using it to contact VKS members. I don't think the Radiodata details we got actually came directly from VKS737 because my mailing address for VKS737 is different from the mailing address of my outpost licence with the ACA.
My VKS737 mailing details are at my current residential address while my ACA licence is at my Parents address. The Radiodata details were sent to my ACA licence address. Having said this it is possible that Radiodata got a selcall listing from the VKS737 website (no address details) and cross matched them against the ACA data files (of which are available to the public after signing a licence). Hence how they had my name details and then got a mailing address for them (different to the VKS mailing details). Beside that fact I don't think the licence they have signed for with the ACA details allows them to send me promotion details from the information they have.

Just a thought,

Brian.

Hi Jim,
by subscribing to bush telegraph, as with VKS, you get use of
the allocated frequencies. Bush Telegraph don't have the extensive
operator attended/sked services of VKS but their facilities are
similar and ACA have allocated the same frequencies to both operators.
The licence allows, as with VKS, mobile/mobile as well as base/mobile
operation.

There are far fewwer Bush telegraph users than VKS.
Their requirements would seem to be different, not so much 'mums &
dads' if you pardon the expression but a bit more self reliant.
Absolutely no negatives intended.

Bushphone+ is purely for use mobile/PTSN/mobile and although simplex,
not for mobile/mobile operation.

The frequencies are (almost) dedicated to the operator.

Regards,
. Rick

operator attended/sked services of VKS but their facilities are
similar and ACA have allocated the same frequencies to both operators.
The licence allows, as with VKS, mobile/mobile as well as base/mobile
operation.

There are far fewwer Bush telegraph users than VKS.
Their requirements would seem to be different, not so much 'mums &
dads' if you pardon the expression but a bit more self reliant.
Absolutely no negatives intended.

Bushphone+ is purely for use mobile/PTSN/mobile and although simplex,
not for mobile/mobile operation.

The frequencies are (almost) dedicated to the operator.

Regards,
. Rick

I also received the radio data paper work in the mail. I had a recent trip from Derby to Darwin, I had the frequency's installed and found the service to be very poor as the only base i could make contact with was Alice Springs. The operator at radio data head office assured my that the Derby station and Darwin stations would be operational within days, well they aren't yet.

From: Ben
Topic: 360 Message: 360

All,
unfortunately my website host has decided to limit my site to 20mb

This means I will have to drop the 8528 manual from my site [currently stands at around 45mb]
I dont want to change the url as too many people know it now. I even saw it posted on ebay this morning!!.
I am looking at other options, specifically other hosts just for the manuals etc.
If anyone has any good experience with free hosts, with at least 25mb capacity please let me know.

In the mean time, please bear with me for the upcoming changes & thanks for the great feedback.

Cheers
Ben

Jim, (and others interested)

In regards to splitting the periods, this is what they (Bushphone)say:

"Two Options"....

1. 12 month access for the whole year...$115.50 inc GST
OR
2. Four month access...may be taken in up to any three periods adding to a total of 120 days in a given 12 months. Two working days notice is required to arrange authorisation..

Call charges:

To a fixed telephone anywhere in Aust....
1st minute or part thereof $1.00 inc GST
Additional minutes of part thereof 50c inc GST

To a mobile telephone...flat rate of $1.00 per minute.

Seems to me the call charges are very reasonable compared to the outrageous charges that Telstra used to make...what was it $3.00 connect fee and $3.50 per minute after that....? expensive calling...

In relation to the coverage....currently I'm at the farm in Benambra, E. Gippsland and late in the afternoon I had no difficulty in calling up the Melbourne base, Cowra base, Alice base, but couldn't get Brisbane...just so long as there is one available for a call if need it.

In regards to the VKS/VMS stuff, yes VKS did get a little annoyed at the ACA for allocating the same freqs to VMS as they had already a large membership base, with 'skeds', base operators, selcalls etc...and there were reports of people transmitting right over skeds and in the middle of others conversations etc...VMS were of course blamed. I don't know the finer details, but it does seem a bit silly to have two very similar organisations on the same channels.

Hope this all helps,

Mark

Ben,
If you are serious do it, I was flooded with calls for my set which I had advertised at $1,600 in most places, on E groups I put it in for $1,200 which was what I was told it was worth and didn't get a single serious call !
From what I have seen easy sale at $1,500, probably could have got $1,700, and the 9323 at $2,500 no problem.

Mick,

Welcome to the group. Just a quick question...in relation to the low batt warning and the in-line fuse, what type of fuse and holder were you using. I occasionally have the same problem. Also, it is a simple 50amp circuit breaker available from auto elec?

Hope you enjoy the group....

G'day Mark

Thanks,

The fuse I had originally was I believe the Codan type, a large black rectangle fuse holder with a long round white ceramic fuse, nothing like a car type glass or blade fuse. From memory it was a 25amp fuse, I replaced it with a 40amp circuit breaker because I had that handy and didnt bother sourcing a 25amp CB, same type as you would fit in line for most auto accessories, From what I have been told the 9323's have an internal fuse inside the main control box to protect the HF, not sure how true that is. I have not had the problem since swapping over.

cheers
Mick

377. Fuses etc

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-04-07 23:49:27 UTC
From: Ben
Topic: 377 Message: 377

Mick & Mark
The original HRC (High Rupture Current - this means the fuse will just blow with a large short circuit current of say 200 amps and not explode like a glass fuse would) fuse fitted is usually around 25 to 30 amps rating.
It is designed to protect the DC wiring, A 40 to 50 amp circuit breaker is likely
to stay on while the wiring melts around it.....
I agree that those fuses do attract corrosion etc, but it would be in your best interests to drop the
rating of your circuit breaker a bit. I have used in the past, household circuit breakers, however the AC rating
is not the same as the DC rating, check with the electrical supplier.
The 85 series & on, including 9323, do have an internal fuse. It is a small strand of wire in the PA section, near where the
DC lead is.
Cheers
Ben

Ok, thanks Ben I will take your advice and I will swap it over for a 25 amp Circuit Breaker. I did try and source one at the time but the local auto parts store didnt have any so i took the lazy way out....used what I had, it has been in back of mind for a while that replacing a 25 with a 40 was not a wise thing to do, but least it has confirmed the old fuse holder was the problem.

Dear friends,

Some times I got superb 8528, Eprom issue 4.2 90-20278 200, option tx
E with as I thought 600 channels. Being hamradio fan I programmed all
P channels (99) for ham use. All works perfect incl.PSK32 and other
digi modes. Problem is I can not activate rest 501 channels if there
are any. Those channels were not mentioned during my reviewing Eprom
program content. What to do? Having tecnical knowledge is it possible
to do job by myself and get all 600 channels? Apreciate any help.
Great Group! Thanks in advance.

380. 8528 Option TXE-A

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-04-08 10:26:59 UTC
From: Craig Huxley
Topic: 12 Message: 380

Anyone else in Australia ever seen this option?

Quite nice to plug in whatever freq you want from the head unit without putting links in

Regards

CRH

383. Noise supression

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-04-09 14:15:49 UTC
From: markeaust
Topic: 383 Message: 383

Just a little not for those interested:

Was looking around at info on supressing noise on the HF (which is about S5-9 on some frequencies and S 3-5 on others) and came across this site which I posted some time ago:
http://www.k2bj.com/Pages/Noise/coax_y.htm
Having followed their instructions, it appears that my RFI may be entering through the coax, as the noise completely disappears when the coax is disconnected from the rear of the set, but reappears when there is only the length of coax running from the set to the antenna, BUT disconnected from the base of the antenna.

One mob I rang this morning suggested fiddling with the routing of the cable further away from the engine bay and also trying this double shielded cable called RG 214.

It is quite expensive though at about $16/m.

Anyone have any other thoughts on this? Worth a try?... given that I have checked all earths and grounded the antenna thoroughly.

Anyone else have significant problems with RFI?

My car is a diesel and thus has no ignition system to worry about.

All comments greatly appreciated...

Cheers,

Mark

Mark,
a few things to try first before you spend $6 a metre on coax, pls about $10 on each connector.
Run the DC and coax on the opposite side of the car to the control leads
Make sure everything is well earthed, scrape off a bit of paint to make sure.
You can then try earthing the body panels to the body etc.

RG214 is quite a lot larger than RG58 and may be hard to run. If you replace the cable I would
suggest RG-223. It is a double sheilded RG58 and pretty much the same size - give or take .5mm
You may get away with your original connectors depending on brand of cable.
I dont beleive this is your problem however.

You dont have a 100 series Crusier by any chance do you?

Cheers
Ben

Ben,

Thanks for the advice about the coax. May price it and see how it compares. Do you know a good supplier of this RG 223 cable?

for your info, the car is a Land Rover Disco Turbo Diesel.

My gut feeling is that most of the noise is coming from the alternator, though most describe alternator noise as a whine. Mine is more hash and chattering. It could also be the oil pressure sender, as the noise virtually disappears at idle and greatly increases with just a few revs, but doesn't seem to get worse as engine speed continues to rise. May disconnect this and see what happens.

Will also try your suggestion about running the coax away from the DC.

BTW, pulled the 9350 apart today just to check the flexible connector which joins the stepper motor to the tuning coil. Mine seems to be a specially manufactured part which clamps on to the motor spindle with very small hex screws. No bits of hose stuff in there that I can see. All appears OK in there. I have also moved it back to the top of the bull bar. All seems to be working quite well now.....Now for the damn CD player which is skipping.....

Thanks again for the help....will keep at it.

Mark

Hello Mark,
There is a thread on this very subject going at the moment on
http://land-rover.team.net/mailman/listinfo/au-lro
There is a known problem with the LR Td5 engine where computer hash is
disrupting radio reception.
The Td5 has ECU controlled fuel injection, not the conventional mechanical
injection pump, and I guess they forgot the shielding at design stage.
Good Luck,
Terry

Hi Mark.
On your noise suppression I have done the following to assist in reducing static

1/ Earth your body system e.g.bonnet to chasis, chasis to bonnet, differentials to chasis, doors to body, exhuast to body. I had problem trying toget earth strap so a just stripped some old 231 coax and kept the shielding and soldered some connectors on each end.
2/ I have had condensors put on my oil sender and the alternator also.
3/ Keep your earth lead from the radio itself short as possible. It put the radio in myself but I then took it to a Codan agent and the result was the earth lead I had put in was way to long. It is no more than six inches long now
4/ When you start earthting out your vehicle you must have metal to metal on your connections. Not metal to paint. Very important

5/ Solder your earth cable/strap connections. Dont crimp them like a lot of auto electricians do.

Hope this helps

Graeme

Okay I give up!!

Can someone please decipher the message below for me. Is the Bush Telegraph service aka Radtel? And (Rick, or others) what is meant by "the frequencies are (almost) dedicated to the operator".

Also....would someone on the list be so kind as to hit me off list with a list of freq's used by Radtel, and Bush Telegraph (if they are a different service provider) or are the BushTelegraph freq's the same as VKS?

Sorry about the 'dumb' questions but I haven't been following things very closely. Now that Telstra's bailed out it's time to check out the competition.

David Graham

Hi Jim,
by subscribing to bush telegraph, as with VKS, you get use of
the allocated frequencies. Bush Telegraph don't have the extensive
operator attended/sked services of VKS but their facilities are
similar and ACA have allocated the same frequencies to both operators.
The licence allows, as with VKS, mobile/mobile as well as base/mobile
operation.

There are far fewwer Bush telegraph users than VKS.
Their requirements would seem to be different, not so much 'mums &
dads' if you pardon the expression but a bit more self reliant.
Absolutely no negatives intended.

Bushphone+ is purely for use mobile/PTSN/mobile and although simplex,
not for mobile/mobile operation.

The frequencies are (almost) dedicated to the operator.

Regards,
. Rick

Topic: 344 Message: 396

Hi David,
sorry for the confusion....
>Is the Bush Telegraph service aka Radtel?

Bush Telegraph & Bush Phone+ are both run by Radiodata, a South Australian company.

Bush Telegraph is similar to, but not so popular or active as, VKS737.

Bush Phone+ is a similar service to the late Telstra RDD service but with no operator connected calls.

The two are totally seperate services...I use Bush Telegraph mainly for car to car communications and don't require 'skeds' etc...hence .not. VKS737....(It is also cheaper)

With Bush Phone+, outgoing calls similar to RDD, for mobile incoming calls...PSTN subscriber calls a Adelaide number & leaves their phone number, this is 'messaged' to the mobile who may then ring....

I haven't used this part of the service but it sounds far easier for callers than the old system.

>And (Rick, or others) what is meant by "the frequencies are (almost) dedicated to the operator".

A search of the Australian Communications Authority dat abses shows that the BushPhone frequencies are not exclusively allocated to Radiodata...there are some other allocations.
>
Bush Telegraph (VMS469) is allocated the same frequencies as VKS737...ie. 3.665MHz, 5.455MHz, 8.022MHz, 11.612MHz, and 14.977MHz.

BushPhone+ (the PSTN connection service) is allocated 3.773MHz, 5.744MHz,5.836MHz,8.027MHz,8.083MHz,9.081MHz,9.360MHz,12.2115MHz and 15.968MHz
All with simplex operation (telstra was mostly duplex [seperate Tx/Rx frequencies])

Bushphone+ have bases at Cowra, Melbourne, Brisbane, Charters Towers, Woomera, Perth, Derby, Alice Springs and Darwin.

Not all bases operate all frequencies.

No affiliation etc.... just a subscriber/user.
All/any errors are mine...etc...

Hope this is of some help.

Regards,
Rick

397. Antenna Freq's

Yahoo group: codan_outback_radio (1997 — 2004)

Mark,

I might add my 2c here too.

The LandCruiser 100 Turbo Diesel (and I suspect the TD troopy and trayback) also suffers the noise you refer to. I've listened to it and it makes teh HF totally useless above idle (and just damn noisy at idle).

In the LC100's case, there is also the issue of glued body panels compounding basic earthing issues. I suspect this won't apply [yet] to teh LR product, but be aware of it.

The LC100 I know of suffered several different issues.
* Poor earthing everywhere an HF radio needs it. (The vehicles own electrical system works fine)Body panel to body panel; chassis to body; b/bar to chassis; chassis to batteries; EXHAUST to chassis (exhaust is acting as an aerial, needs to be grounded towards to the tip); etc etc
* EMI emmisions from the wiring to the fuel pump. The vehicle I saw had ferrite inductors (like the things on VGA monitor leads) placed around the pairs of wires controlling the fuel pump.
* poor earthing of the HF radio - two interior earth points only 1 metre apart produced vastly different results.

Since Toyota installed the radio as part of the initial purchase a lot of the problem solving was handed to an HF installer shop. They have spent a total of about 20 days that I know of trying to resolve this.

The ECU for this vehicle hit the dust as well and the Toyota dealer the vehicle was towed to said it was caused by the HF radio....when they found out that another Toyota dealer had installed the HF radio the problem was fixed at no charge. :-)

All the best in resolving this and I'd be interested to know how things turn out.

The PA stage in the codans will adjust the output power to suit the VSWR.
Good VSWR will give you max power (bright TX LED) Terrible VSWR will give you about 6 watts (dim TX LED) so even an autotune that doesnt tune, may still get you out of trouble.

7727 are crystal controlled. you would have to buy a crystal on 8022 .
Bit rusty here but I think you need two, one for transmit, one for
receive. Then you have to tune the set to that particular freq. going
from 7600 to 8022 would not be that drastic and you may just get away
with out a tune.

Only need the one crystal ($20), and probably different capacitors
($4) as specc'd in the Codan service manual. The existing tuner coils
are fine.

For someone with a CRO and freq generator it's about 30 mins work.

Ian B
VKS737-N87

PS: The 7727 is still a lovely radio to RX on when there's noise
about.

Ben
I used to own a 7727 and can definitely say that only one crystal is needed. It is not a big job to tune them (If someone has the correct gear, Cost me a few beers) took about 20 minutes. I replaced one crystal (8450??) with the 8022 and had to retune. I still have the address where my crystals came from. if anybody wants it.

410. 100 watts or not

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-04-22 09:43:21 UTC
From: Mick Barson
Topic: 397 Message: 410

G'day All, Ive been asked by a mate...KIMBO who is to slack to ask himself :-) whether all the HF's should transmit at the max 100W, he has a NGT and upon doing a status call , it showed 70watts the same as two others, is this normal or dependent on a range of different issues.

Also is it possible to check on a 9323 or does one need a meter ?

Thanks

Mick

G'Day Mick, the 100w reading is a nominal figure that is affected by numerous things. Even the "watts" rating can be measured in different ways.
Broadly speaking yes it should put out 100W into a matched dummy load. Into an atu it may or may not. Does the power figure vary on the channel? Its probably the aerial.
Anyway the difference between 70w and 100w isn't as significant as you would think. For example the difference between 50w and 100w is about 6db. This is the smallest difference is level that most humans can hear.
Oops there I go again.
In the case of the 9323 I suggest a quick run to a techo with a suitable meter.
Cheers
Jim

Codan quote their Single Sideband output as a Peak Envelope Power (PEP) figure. Because there is no carrier to speak of, It is rather inaccurate to measure with a normal wattmeter designed for AM or FM. Spectrum analyzer is better. Dunno about the NGT but 85 series are capable of 125Watts PEP. Most were set at 75 watts. One meter I use measures this as around 50 watts

Ben Is Correct,

Sideband Radio's produce no output RF Power at all with zero modulation.(no speech etc...)
To measure the output power correctly the radio must be injected with a Two Tone test signal.
Most radio's that measure there own power output level are only an indication that is relative to the load apllied to the final output stages of the P.A.
To accuratlly measure the output, to say, test the condition and final stage tunning, the radio must be injected with a two tone source and the output must loaded into a Non-inductive 50ohm Load with a know VSWR via an Accurate power meter such as a Bird 43 etc etc....
The output must also be sampled and monitored with a CRO , to make sure the radio is reaching the correct modulation level.
This is why "Power Mics" were popular to CBer's a few years back.....Poorly setup radio's with low modulation could benifit from the "Extra" Modulation and Produce more output power.

Sorry for the long winded note,But although I am a Television Engineer now, I started out in radio way back when Owning a CB could wind you up in jail.....boy those were the days I'm probly the only one who can remember the Protests and convoys to get CB legalized...Hi Hi.

John

Just read my last post, and Don't want anybody to think I think of
the HF band as CB(27megs).....
We all know people on the HF band are a lot nicer!!!
I haven't had to turn the Codan off once due to swearing like on
the "Domestic Bands"

Sorry for the jiberish but I know Hams get very upset when called
CBers and I'm sure Offroaders etc are the same.

Oh Well

John:)

Fine on th e 8528 puttingout a 100 watts. i was sitting in the car park at work and tuned into a station on 20 meters. They guy was in France . I put out a call and he came back and said I was five and six in signal strength to his qth 30 k south of Paris.
I am quite happy with that

Topic: 418 Message: 418

My response to Micks posting was designed to be relatively non technical. I see that the topic has been taken further, although I'm not convinced that the average user could follow most of the discussion.
SSB radios can in fact produce significant output without any modulation, depending upon carrier null. Of course channel SSB receivers would be largely unaware of this.
The two tone output test is a way of measuring PEP. For the average user, whistling loudly into the mic is a much more achieveable proposition.
I notice that Codan give several ways of measuring RF out, depending upon the type of instrument being used.

" .....Poorly setup radio's with low modulation could benifit from the "Extra" Modulation and Produce more output power."
These usually resulted in overmodulation which interferred with other channels. Lots of fun but technically a no no.

"I'm probly
the only one who can remember the Protests and convoys to get CB legalized...Hi Hi."

Wanna bet? :)) An article I wrote on legalizing CB radio from the amateurs point of view was quoted in QST mag. Ancient history now but hey I'm pretty ancient. :)))

As for an NGTs power output being measured by another radio, kinda sounds like the horsepower of one vehicle being measured by another vehicle and probably just as accurate. I'm quite happy to loan Kimbo a Marconi Wattmeter if he pays the postage :)

Cheers
Jim

Hey Jim,

I don't Feel Quite so Old now.....Hi HI...I'm Only 38 but it sure seems like a lifetime ago when all that was going on.

John

Ps. Quite correct in regards to the carrier null.....I was trying to point out in my fumbling sort of way that talking into the microphone gives a poor indication of power output power....and just pressing the mic button will give "no output state", taking the state of the carrier null into account of course.
whisling into the mic is one way I suppose...But it usually annoys the wife and neigbours when I'm tweeking in the we small hours..HI HI.

Cheers
John

421. NGT

Yahoo group: codan_outback_radio (1997 — 2004)

From: Ben Hobson
Topic: 421 Message: 421

well
the NGT is certainly an interesting beasty isnt it.
took me 1/2 hour to work out the free tuning receiver.

1 hour with the programming software, which at $500 you would think
would at least come on CD not 9 floppys, and I have 5 channels
programmed.
I learnt that although you may have channels, they are no good unless
assigned to a network.....

I'm hoping it may become easier to use as time goes by.

BUT, I see no reason why Bushphone & Bush telegraph can not exist in the
same radio. (This was mentioned by someone before) I am assuming they
both use codan selcall??

I do like not having to press the tune button anymore!

any tricks from existing NGT users welcome.

Cheers
Ben

Mark

It will do any freq from 2mhz to 30mhz.
will not do AM but it is mentioned in the manual
All options ,which are similar to the 9323 (GPS etc) are woken by
enetring a code.
at this stage appears you cant change freqs off the front panel. TXD is
standard. I guess TXE is another option?

They are only 400 channels

Inside the radio is all Surface mount IC's with lots of sheilding. The
PA stage hasn't changed a lot. It looks very much like a '28 with a few
more filters.

I think if set up properly in a network with ALE (auto link
establishment) so all you do is pick up the mic and talk, it would be
brilliant.
but for VKS, RFDS etc and general playing, I'd stick to a 8528 at this
stage.

Speaking of programming channels, apparently my 8528 has had a "MOD" which allows it to be programmed via a small silver button on the back on the main unit.

Anybody know the details?

cheers

Brian,
have at look at my site
http://ozradio.tripod.com

It has the details of how to add P-Channels (user programmable - max 99)
which is what this switch is for.
basically hold down the switch as you power up the radio, then follow
the steps to add channels

direct link on P-channels

http://ozradio.tripod.com/pchannel.htm

cheers
Ben

Hi Glenn, depends on what you're into. A good start is the ACA database or if you're casting your net wider try a search engine. There are a lot of SWL sites out there that usually give you some direction.
If into outback comms try the 737 site for frequencies and sked times. Another one is the amateur travellers net on 14116khz
Cheers
Jim

Thats right Keith,

Realistically there is no use in having a frequency in the radio unless you have a use for it and a licence to use it. There are many thousands of HF frequencies of which you can fit around 400 in your radio. With Telstra's RADPHONE network gone you really should only have a need for the RFDS and any other networks you use such as VKS-737, Bushphone, Radio Data (dare I mention that name) and any other networks you may be a member of. I also have all of the Police HF frequencies in my radio for receive only as I am not licenced to transmit on them, there is little traffic to listen to there either - as the cops are phasing HF out slowly in most parts and replacing them with Sat phones or in SA the GRN in many parts. The only other frequencies I have are the radio stations such as radio national in recieve only as there is no use transmitting to a station that only transmits and doesn't listen.
The reason I use the software is simply for ease of programming (I can put channels where I want, when I want) rather than paying someone else $80 odd dollars every time I want to change something.

Brian.

GDay Brian
Mate, could not agree more. Maybe I should have been more careful with my message. When I asked about frequencies to program in, I was talking about frequencies to listen to, not to transmit on. VKS is interesting to listen to, (I am a member), but there is not much on it during the day. I once emailed school of the air for their frequencies so my kids could listen (listen only) while we were outback, but they wouldn't reveal them to me. I apologise to Ron if he got the wrong impression of my request. I understand you do not require a licence to listen. If I am wrong, feel free to correct me. Again, sorry to Ron and thanks for the replies.

I once emailed school of the air for their frequencies so my kids could listen (listen only) while we were outback, but they wouldn't reveal them to me.

The following are frequencies for Australian Schools of the Air. All my information is from the Australian Communications Authority RADCOM frequency database. All Frequencies are in MHz.

NSW Department of Education:
ACA client number: 398844
All of these transmitters are based in Dubbo

4.6365
5.1315
7.5665
8.1515

Alice Springs School of the Air:

3.8585
5.3415
5.3715
5.8160
7.7615
8.0365

Capricorn School of Distance Education:

4.0195
4.6135
5.1585
5.4285
5.8055
7.3085
7.6385
8.0125

Charleville School of Distance Education:

4.0465
4.5030
5.2445
5.2285
5.8545
6.9465
7.7935
7.9315
8.0465

Cairns School of Distance Education:

4.4585
4.8815
4.9275
5.3015
5.8665
6.8005
7.3585
8.0065
11.0165

Charters Towers School of Distance Education:

4.4645
4.5845
4.7925
4.9935
5.2225
5.8515
7.4765
7.5315
7.6325

Mt. Isa School of the Air:

4.5475
4.8015
4.9365
5.4465
6.9665
7.5025
7.8045

Pt Augusta School of the Air:

5.1465
5.8465

Katherine School of the Air:

4.8615
5.7325
5.8160

7.3415
8.0155
11.5865

Longreach School of the Air:

4.8705
4.9765
5.3065
5.1175
5.4250
7.6445
7.8865

Meekatharra School of the Air:

4.8815
5.2615

Carnarvon School of the Air:

4.9275
5.2315

Kalgoorlie School of the Air:

5.0115
5.7415

Kimberley School of the Air:

5.2015
5.8515
6.9265

Port Headland School of the Air:

5.4465
7.4465

Education Department of NT

2.7295
2.8015
2.8145
3.1595
3.1775
3.2915
5.4015
7.9240

NT Open Education Centre
ACA Client number: 4861500
No frequencies aloocated

This should be enough to wet the whistle and fill all those spots that are no longer required for Telstra RADPHONE.

Brian.
VKS-737 - R-990

442. 9323 Front Panel/Remote Head

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-05-13 13:17:48 UTC
From: markeaust
Topic: 442 Message: 442

Hi everyone,

Am looking for a front panel or spare remote head for 9323. I haven't even enquired with Codan o the price, but I imagine it would be outrageous. Need to be able to remove the set from one vehicle and puti nto another with tapped whip. Maybe someone has a busted set with a good remote????

The only other way I can see to do it is to put a 'D' connector in the cable from the remote head so it can easily be removed, along with the body of the set itself....Hmmm some more thinking on this one.

Anyone have any ideas??

Thanks,

Mark

Date: 2002-05-13 21:32:41 UTC
From: Brian Lea
Topic: 442 Message: 443

Mark,

If you take the back off the 9323 head there is a quick disconnect connector in there also. Will save putting the extra connector inline. A word of warning on the price of a head though, I had to buy a new remote head lead (radio to the head) a while back and that alone cost me $50. You may be better off trying to source a connector for the head end and making your own sheilded lead if you feel confident. By the way I wasn't able to source the connector for the head so I ended up buying the lead.

Brian.

444. 9525B Selcall problem

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-05-14 05:52:54 UTC
From: amaruskanic
Topic: 444 Message: 444

Hi all,
I have a 9525B and I am having trouble with the selcall. I am told that the 1000's digit being transmitted is incorrect. ie does not match what is set on the remote headset switch. I have checked the (i guess they are pots?!) switches inside the main unit and they are all set to 0's. I have also given them a spray and clean with contact cleaner.
Anyone have any ideas?

Also I believe I can upgrade to an 8528 by replacing the remote head and the eprom. What do I gain by doing this? Are there any 8528 remote heads available out there and what is the damage to the hip pocket?

Thanks Andrew

P.S - Great list.

445. 9323 hand piece

G'day All,

My 9323 hand piece no longer has back lights, No real big deal, but handy at night, at first one side stopped working now I notice the other, I did take it apart to check when the lights 1st went out and saw the bulbs seem to be connected to a circuit board and not replaceable. Is that the case? Do I need a new circuit board? any idea's of cost or suggestions.

Cheers

Andrew

Do you mean a 8525B? Usual problem is the thumb wheel switch just dies.
You could pull apart the control head and try to clean the contacts or
source a replacement. You will only need to replace the faulty switch,
not all 4.
You also have to have a valid self address which is set by one of the
rows of switches on the selcall board inside the set.
Yes, you can upgrade to a 8528 by replacing the head and eprom. Eproms
are easy, just reprogram your existing one. Control head is a problem.
They are rarely available 2nd hand. They were available new from Codan a
few years ago. I am unsure if they still are and at what cost.

Cheers
Ben

Lights can be replaced. The bulbs themselves are usually cheap. I am not overly familiar with the 9323. Anyone know what voltage they may be??

Ben,
Yes - thats an 8525B and a finger problem.....

I don't have the 9323 in front of me but I'm almost certain they are LED's rather than an incandesant bulb. If they are LED's they are about 3 cents each. The only problem is being able to solder you probably want to be pretty confident with the iron, and making sure you get the LED round the right way as the are a "Light Emmiting Diode" and diodes are polarised. Even before you replace them throw a volt meter over the back of where the light mounts to the circuit board and make sure you have around 3 volts showing across the meter.

Brian.

Hi Andrew, the 8528 has a higher resale value(approx 200+ more). You
get an extra 200 or so more possible chan. The 28 can direct dial
phones, displays frequency and chan and best of all has backlights
for night useage. The 28 will drive an autotune aerial with the
addition of an AD card, and can accept amateur band programming. It
also has a few more facilities I can't remember offhand.
The 8528 heads are around 200...250 $$ at the moment but
unfortunately they are very scarce. Quite a few of us on this list
would love to get our hands on a cheap supply :))

Cheers
Jim

Thanks Ben & Brian

I do think they are led's, I will do as you suggest Brian and investigate further.

Cheers
Mick

8528 are 601 channels
501 in the eprom, 99 user programmable

8525a/b are 99 channels

453. 8525B Selcall - followup

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-05-15 22:23:16 UTC
From: amaruskanic
Topic: 453 Message: 453

Howdy again,

Well I had my radio out to Watts in Canberra, we pulled it apart, looks ok, tested calling someone locally, no problems.
So last night I call up VKS737 - St Marys to test. Aarggghhhhh. It was all over the place. Digits were incorrect all over the place.
Now I am no expert on radios, push the button and talk is about my limit. Can someone tell me how reliable selcall is? Is it possible the signal is being corrupted between Canberra and Tasmania. I dont want to spend lots of money chasing a problem that may not exist.

Anybody in the ACT region who is willing set up a time to allow me to selcall them. Want to try different equipment and area.

Thanks.

Andrew

Andrew
codan selcall does not change. If the propagation is poor it will not decode it at all. Canberra to St Marys is not that far (200km at a guess)
the only thing I could forsee is an intermittant fault with your selcall switches, OR the radio is off frequency.
Email me off group, I may be able to help with selcall tests

Ben,

The St Marys that andrew was testing to is in Tasmania no NSW near
Sydney. The distance would probably be closer to 1200 not 200 KMs

Andrew, your problem is more likely the selcal selection switches..
which selcall is scrambled, the called number or your calling number.

regards

Geoff

Very useful info, especially if you like to hear 30 kids all
saying "Good Morning Miss Whatever" at once on the same frequency.
Mind you it's an eye opener to many city kids, especially when they
find out that
a) the kids have a live in tutor and
b) they get a lot of the rest of their work in the mail!!!!
c) they get to travel to a centre once in a while to see/meet their
teachers and fellow students

Cheers

Jim
You must have some good listening frequencies you can add here
for the group, mate. ;-))

460. Re: HF Frequencies

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-05-18 01:55:16 UTC
From: hz180
Topic: 431 Message: 460

Well, umm..yes and no. It all depends on the individual and their tastes. For example I have little interest in o/s broadcast on sw or LW. Others are very interested. As mentioned previously much of our utility traffic now goes via satellite or is scrambled. Even so there is a whole swl industry out there selling decoding gear etc in this specialized field. Other swl's may listen on 1200meg and a dish for SETI signals, another specialized field (but more common than you may think).
There is still the occasional cw signal of interest. Of course you need to know Morse to start in on the action here.

As a start I suggest you check out http://homepages.ihug.com.au/%7Evk5vka/bcast.htm for some interesting frequencies.
There are also numerous books telling you what frequencies worldwide services use but a quick visit to the above will whet the appetite.

Cheers
Jim (of course the most interesting HF frequency is the one I am using at the time :))

Morning All,

Hope I am not repeating a question but I am seeking the following ; -

1. A person in Sydney that can program a 9323.

2. A manual for a 9323, or users guide.

3. A spare voulme knob again for a 9323.

Kind regards,

Brian
Sydney.

Brian
the 9323 software and programming manual are available on my website
the pinouts for the programming lead are there also

http://ozradio.tripod.com

cheers
Ben

Brian,

Get ready to get hit with a hefty cost for anything to do with Codan.

There are a couple of mobs in Sydney that can program them for you. at around $80 a pop. The volume know will probably cost a heap. If you just want the actual plastic bit try going to Dick Smith and see if you can get a $1 knob to fit it.
As Ben has already stated you can get the software from his web site and the pinouts and manual are there also.
I downloaded the software and the manual, bought a mic plug from Codan ($50 - another rip off) and reprogrammed mine (It works too). All the cable uses is Ground, Data in and Data out from memory. These are the same pins on the RS232 plug at the back of the set so you sould (read should - I haven't tried it) be able to program from the back of the set with a $5 of parts from Dick Smith.
The other options are to download the software and make up the program yourself and then take the job file to a Codan dealer to have it loaded (may cost less) or to make a spreadsheet with all your channels, Selcall, Emergency channels etc in it and give the sheet to the Codan dealer to program. For the cost of a program of the radio you don't want to have to do it twice.

Brian.

Other dealers I think that can program Codans are Kareera in Northern Sydney and Pheonix comms in Sylvania (South Sydney).

Brian,

I have a 9323 and as yet do not have a programming lead, though I do have the software, courtesy of Ben's wonderful website. It is possible to program the set from the front panel, simply by following the instructions on Ben's website in the 9323 section. The TPE link can be shorted on power-up of the set, thus allowing TX channels to be programmed via the front panel. If this feature is required regularly, a switch may be installed, thus negating the need to continually remove the bottom cover of the set each time. It really is quite easy...no special skills are required....and certainly better than forking out $$.

Cheers,

Mark

All
something I havent tried is to mount a 2.5mm stero socket in the back of
the control head with the data lines & earth connected to the mic
socket.
It would be cheaper than a codan programming lead.

Mark,

When I was first looking at re-programming the radio (as a result of the dealer selling the radio to me having no idea about what they were doing and stuffing it), I went to a Barrett dealer who showed me how to do the Codan "pin shorting trick" Biggest problem was all the manual labour involved in adding a few extra channelsl and moving some others, as well as programming selcall in it (the dealer didn't know how!!). The major problem being the radio was in a head console and I was getting really sore arms reaching up there pushing buttons and turning dials (It was a harder job removing the radio from the car).
I got the software, made the lead (10 mins work), made the job file up, took the laptop to the car and Bingo - new radio.

It can be done both ways, I just suppose it comes down to which way you prefer.

Brian.

GDay Brian
When you made your lead up, did you go the microphone plug or the stereo
plug way as per Ben's site?

Keith,
Personally I would spend $2 on a stereo plug than $50 on a mic plug from
Codan, however I have not tried this mod as I dont have a 9323. I am
keen to here some feedback from anyone who tries it.

Ben
Thanks for your reply. Is there a wiring diagram showing what pins to
connect to where. I presume you use the serial port for the
programming. Thanks again.

473. 9323 Programming

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-05-23 07:43:54 UTC
From: Hobbo
Topic: 473 Message: 473

Keith,
If you go to this page on my site
http://ozradio.tripod.com/9323.htm
and download section 16 of the manual, it gives the cable pinouts for
the programming lead.
just pick up the tx, rx & ground connections off the back of the
appropriate mic pins and wire to a 2.5 or 3.5mm stereo socket mounted in
the control head. the other end is a db9 pin connected to the serial
port of your pc.

To all that want to make a programming cable for the 9323,

I made mine with a genuine Codan Mic plug ($50) However it will still work just as well by attaching the leads from the back of the mic plug (i.e. solder to the board) to a stereo socket (or any other socket with 3 pins) as Ben has said. The only warning I would suggest if making the lead up with something like a stereo socket is to plug in the programming lead to the radio side first with the power disconnected from the radio. The connection to the computer and the power for the radio should both be done after this. Reason being you may get a short between the wrong pins as the connection is made. Or you may send voltage down the line from the computer to the radio on the wrong pin. Both of these may cause damage to your radio.

I can't say if this is for sure, it is just a warning before you kick yourself for trying it and blowing up a radio.

Brian.

Brian,

Agreed! I will definately be making myself a programming lead as I have the software, but in the interim, the other method works well for me....bye the way, where did you put the stereo 2 pin socket? In the remote head itself? I thought the actual microphone might be OK, rather than drilling holes in the remote head....any thoughts??

Cheers,

Mark

The micrphone should have enough room in it. Depending on how much room the PCB takes up in there. I didn't use the stereo plug, I bought the mic plug from Codan. You might want to have a look at the signal in the RS-232 port at the back of the radio also. This had Gnd, Data RX and Data TX on it. The port can be used to remote control the radio with a computer so it should also be alright to program it with. I will give it a go when I have time.

Brian.

Keith,

The address is as Ben has said below. The reason this is the way to deal with Codan in NSW is there was a big poo fight and hissy fit went on a while ago (I've forgotten what it was over) however all the Codan dealers suppliers in NSW either cut their contacts with Codan or Codan cut their contacts with the dealers/suppliers. As a result while you can still get Codan service done at many places in NSW and you can buy Codan equipment from many places in NSW, McKays is the only Authoried distributor for Codan in NSW and all buisness goes thru them. Thats where I got my mic plug from and my spare remote head lead (both $50). Don't tell them you want the plug to reprogram the radio as they are very funny about that sort of thing. Tell them something along the lines of you want to bring data out of the head (because it is handier to get it from there than the back of the set), or because you want to hook up your own microphone to the radio. Something along these lines. If you do want to go and actually buy parts for the radios I have posted some parts below. I have posted straigh out of excel so I hope it works. If it doesn't send me a private email and I will post the excel file to you direct.

Brian.

Des,
welcome to the group. You will need a licence to transmit on whatever particular service you
are using, RFDS, VKS-737 etc etc. Coming from the ACA I am assuming it is a RFDS outpost renewal?

Cheers
Ben

G'day Des,

If you belong to a service group like VKS737, RADTEL etc. then the outpost licence is not required as you are covered by their licence. If you want to use the RFDS channels and other similar available channels then you will need to renew your licence.

regards
Geoff

486. Base station aerials

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-06-02 09:30:00 UTC
From: hz180
Topic: 486 Message: 486

What sort of base aerials are our members using (to listen of course:) ? Bit of string with an ATU ? Autotune on garage roof? Commercial wide band travelling wave dipole ?
As I am due to play aerials at home I'm interested in the experiences of others.
Thanks
Jim

487. Re: Base station aerials

Hi Jim, I've been playing with that myself. Currently using an old tapped vertical sitting on a metal stand (ground plain). Not as good as the vehicle but ok just to listen to 8022. The ground plain is the trick. Have toyed with making a invert v but my calcs suggest somewhere around 60 feet in length

cheers
Glenn

Thanks Glenn. Yes the wire lengths are a bit long for the average listener.Luckily I've got plenty of space here as I bought the property with aerials in mind, and have played quite a bit over the years. Unfortunately I want to cover the 3-30meg range and don't really want to have multiple aerials so I guess that I'd probably end up with something like a travelling wave aerial. I'm just not sure how they perform.
The other night I had a whip inside the garage and 737 Perth base was booming in. So were the mobiles. The garage is brick and colourbond construction so sigs must of been good outside :))
Cheers

Chris, yep sure have. They have recently introduced a "kit" concept which may prove useful to some. I have my reservations about travelling wave aerials. They tend to have swr excursions that are not advertised and the signal strength is down considerably compared to a dipole.
These things might not be so critical for our application but they certainly are when trying to work Dx on 20m :))
Having said that I am leaning towards trying a design (maybe using Bushcom kit bits ?)that can be found at
http://www.paws.dircon.co.uk/draka.htm
Its a big aerial but can be built out of easy to source bits.
For anyone interested in the technicals of aerials, there are some excellent resources at http://www.cebik.com/radio.html
I suppose all these damm frequencies we have mean an autotune or a TWD. I was thinking of multiple dipoles with single feedpoint until I found out about the fiddly bits.
Yes I know a bit of string with an atu might be ok for listening to one freq...but scanning a few ??
Cheers

From: Graeme
Topic: 491 Message: 491

I do not object to people buying commercially made antenna's but if you could get hold of an antenna design that is simple to make, low cost (save dollars) and had the satisfaction of making it yourself would that not be better. I made an antenna up ten years ago that cost me less than sixty dollars to make, operates from three megs right through to 50 megs and I can legally put four hundred watts up it .

Graeme

Home brew is the only way to go...until you get too old to get up the tower (mine has sat on the ground for 6 years) and to throw things over the trees (which used to be manageable:).
Commercial aerials often give you more time in the shack. If thats where you're happy, great. Home brew gives you more time out in the yard I guess.
3 meg to 30 meg. 2 questions.
1. Does it use an atu ?
2. How well does it work below 10 meg ?
If its useable as an effecient aerial for radios that scan the frequencies this group is interested in, how about sharing ? I'm sure a lot of people here would be interested.

Cheers

Guys,

In relation to the 'paws' website below, I helped an amateur radio friend of mine build one of these things a few years ago...just for the purpose you were talking about. We used green insulated copper wire for the radiators and bult the baluns and resistors in small PVC pipes. The spreaders were made of PVC also...the weakest point, due to the bending effect when the thing was strung up. I still have all the bits at home and may re-build it soon when time permits, now that I have some country property to fit it! At about 40 meters long, it is a tad difficult in the city! I must say though, it worked a treat. I don't know all the technical stuff, but I did have it plugged into a 2 way coaxial switch and compared it to the old codan autotune...it's a different world!!

Now that I have a mate travelling up north for a few months, now may be a good time to re-build it.

Cheers,

Mark

I think the spreaders were made of aluminium in the original
construction article.
Cheers

For another approach try http://users.erols.com/k3mt/windom/windom.htm
This aerial has been used by Deane VK3IL who also checked it out on
RFDS and 737 frequencies.

From: wresat
Topic: 497 Message: 497

Hi All,

Perhaps just off the topic about HF stuff, but by Codan 9323 sits just above the GME in the Hilux and I had a thought!! I was wondering if anyone knows about the programming of the GME TX3400 so as to receive extra channels (about 10 I think). I know it can be done at the shop, anyone know of any links to info on how to do this at home?

wresat

498. Re: GME TX3400

Date: 2002-06-11 22:36:22 UTC
From: markeaust
Topic: 497 Message: 498

wresat,

Had a look through radio-programming@... and the best I could
come up with was:

"Give andrews communications a call they'll sell you what you need.
others will say no no you can't do this but you can do that and
they tried stuffing me round to the hilt.

Talk to the crew there they where straight down the line with me and
knew
what they where on about."

There was no recorded information on the schematics of the cable or
the programming software.

I've also been through this situation a few times and have progressed
from over the counter CB's, to Phillips FM 900's (better but too much
mucking around burning EEPROMS), now I have a Tait 2020, for which I
have the software (readily available) and the programming cable
(easily built or easily bought). Now it's really easy to add/change
Tx/Rx channels, even on the move with the laptop! The other option
of course is a scanner....

Good luck,

Mark

My understanding is that the GPS communicates with the HF via RS232 cable.
You can then get lat/ong displayed on head unit. Also you can interrogate a
remote HF via any frequency to reports its position.

cheers
brian

You need a code programmed in before the 9323 will work with the GPS,
don't you?

Paul,
they are programmed via EPROM or you can add 99 channels yourself (8528)
only
8525 & 8528 will do recieve 0 to 30mhz
8525A TX to 16mhz 99 ch
8525B TX to 18mhz 99 ch
8528 TX to 30mhz 601 ch
I have a 8528 for sale, complete mobile setup with autotune antenna
Email me off list if interested.

509. 7727C info, circiut required

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-06-17 08:43:13 UTC
From: phonetic_au
Topic: 509 Message: 509

hiyas all,

i picked up at a trash and treasure market a codan 7727-C radio it seems to work ok even managed to work out the freqs and general operation.

unit has got 2 channels installed and selcall unit.

im after some info circuit diagrams service info ect,
hope some one here can comtact me or point me where can download some info on line, thinking to excite the xtal oscillator(rx+1650Khz) with my siggen to use as a monitor rx maybe maybe cook up a rx preselector tuning coils.
got at a price of a pizza so happy to muck around :)

email: phonetic_au@...

thanks in advance

regards
frank

510. GPS update

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-06-18 22:21:52 UTC
From: Graeme
Topic: 510 Message: 510

Further to my question the other day about the GPS function I have found out the following. The VKS-737 network has made application to the ACA for two data only frequencies to be used in exclusively for GPS data. The issue of the frequencies is still pending.

Graeme

511. Further inteference worries

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-06-18 22:27:00 UTC
From: Graeme
Topic: 511 Message: 511

reading the latest mag from VKS-737 there is an article in there stating more possible sources of interference.

The first one is an electronic rust preventing gadget.

The second one is some electronic battery management systems

The third one is some of the latest fuel injection designs

Any comments

Graeme

Sources of electrical interference whilst mobile can be numerous.
Since switching to diesel 20 years ago I have not had any major
hassles. Oil pressure sender units can be noisy, as can windscreen
wipers but thats about all I can think of that I've noticed.
Modern 12v to 240v inverters can also be a hassle because some
produce less than sine wave output.
Pitrol engines can be a PITA for noise. I know of one 4wder who only
switches the radio on when he's stopped. There are ways of minimizing
such problems, but they are often very time consuming. Some good
advice on what to do about this kind of interference are to be found
on the web.
Cheers
Jim

I suspect that another use of the projected channels might be email via radio. This is common in other services (e.g. marine). Imagine trying to email someone while bouncing around Cape York. Or driving quietly for hundreds of k when suddenly a voice booms out "You've got mail"!
Personally one of the reasons I go bush is to leave the SPAM behind :)

Cheers
Jim

Hi guys,

Two other things that I heard but not proved

If the HF aerial is mounted very near, vertically on the rear, the steel belts can cause a problem

And that the latest high pressure diesel injection units, ala discovery, maybe prado and maybe new pajero can cause interference.

cheers

Graeme and others,

Although I drive a diesel (Landrover Tdi, 1992), I still have significant noise problems and have been in the process of researching the subject of RFI in mobile situations.

The interference that I get is minimal at low revs (non-existent with the engine off) but increases with engine revs. It is so bad thatat 5mHz it goes from S1 with no engine to S7-8 with the engine aon and revs at about 2000 It is a combination of 'buzzing', 'hash' and some popping sounds. All of this disappears when the coax is removed from the back of the set, but re-appears when the coax is re-connected to the set, but disconnected at the antenna end.

I also read this article and immediately went out and disconnected both battery leads and pulled the appropriate fuse from my Piranah electronic batt isolator, hoping for an instant cure.....alas, no change.

From my reading, my interference is highly suggestive of RFI entering via the coaxial cable or picked up by the antenna and may be partly remedied by replacing the coax with better shielded stuff. Also, it may be caused by inadequate earthing of the car panels, bonnet, chassis, bullbar, bumpers, antenna etc. However, solving the noise at its source would be best and I think the alternator is the major culprit...research continues for the appropriate filter.

After earthing everything I can, other things that I will be checking will be oil pressure sender, coolant temperature sender, fuel pump...

Any other helpful comments greatly appreciated...

Mark

Brian,

Come to think of it it may be cheaper to replace the car.....!

Though it surprises me that it is so problematic as there are no
great fandangled electronics on this car like the newer versions TD5
etc...

Will keep working on the cheap fixes before I give up!

I have had similar experiences regarding interference on mobile HF, so far the normal practices of earthing panel's etc should cover most problems like aleternator/air con etc. - keeping straps as short as possible and use conductersizes to a reasonable size. ie 16mm and up
I had particular bad interference up to about 4MHz at one point on my 60 series and placed short strap form the alterantor body to the closest body panel, put straps on the bonet to engine bay and short strap from antenna base to body... you can measure all these parts on your vehicle and they are bonded together but at DC not RF ...its different .
Work vehicle is nissan Patrol TD42. It has particulary noisy indicator's, fan and air con. I have installed heaps of radios in Toyota's and never had problem apart from alternator noise which I solved with above notes on short bonding straps. mind you all diesel.
for cheap earth bonding straps use RG 213 coax offcuts and cut out the braid, flatten on bench and spray with lacquer.
regards

Start with the major sources first. What we are looking for is anything that might generate RF. Don't forget that we are trying to stop this RF getting into your radio/aerial. Step 1 is to strap as much as you can as per the post below. I have found a transistor radio with a few s/w bands to be a handy tool here. Either that or something that's deaf with an attenuator, signal indicator and a shielded probe to wave around. Once you know what it is you can then nut out a solution. Problem is, as other posts have mentioned, in a modern vehicle there may be many sources, each requiring a different solution.
Haven't heard much about probs with rear mounted autotunes. I guess it depends on just how close to an object it is mounted. Certainly one might expect some detuning effects but the atu, if properly mounted, should compensate for the extra capacitance.
Although come to think of it there's a great steel wheel that's probably earthed sitting right next to the atu.
Personally I like to see when I've broken the whip top off on a low branch so mine's mounted on the front.
Cheers
Jim

The new Nissan 3.0 diesel turbo is shocking for RF noise.
The windscreen wiper is one culprit, but the main offender is the
engine/air con thermo fan.
the fix is to put a couple of 1uf caps across the supply to the fan and
earth the body of the fan (its mounted in plastic) I havent chased a fix
for the wipers, it doesnt rain much here!
My falcon wagon (yes) is pretty RF quite beleive it or not, especially
with all the elctronics under the bonnet.

Yeah well the trouble and strife said "you buy that thing and put that
telegraph pole out front, then you'll be out front with it"

I put it on the rear....

cheers
brian

Actually I'd like to make it legal by putting it on the back. It is a bit offputting for any passenger at first but they get used to it. My better half just gets upset when I pull up at garage and female attendant says something like "my, what a big one " :))
It's even been mistaken for a radiator extension and a secret speed radar. Strangely enough, when I just use a whip nobody gives it a second thought.
Cheers
Jim

Graeme,

One on the 80series list a while back was a chap with a new 100series TD (1HDFTE engine- electronic common rail fuel injection).
His interfence was both ways.....when the Codan transmitted it woul dcut the CPU for the injection and said truck would no longer go until no transmit. When someone said, easy just don't transmit he mentioned Selcall answering which is of course automatic.

Craig
(wondering if the invertor he just installed is going to interfere with the 8528)

Wine, women and RADIO ? Have never experienced them all together.
I will listen and see if I can keep track of the group. Although
Alice Base is on a bit early for this side of Birdsville. Even
Adelaide is a bit early some times. And by the time St Mary's fires
up you'll all be asleep I rekkon.
Last time you were away I gave you a few selcalls. Probably didnt
hear the phone, too busy on UHF:))

Cheers

Guys,

Thanks for all the advice re interference on radio and with partner.....! I will take it all into consideration....?

Just for extra info, Barrett have an interference suppression kit ($99 + GST), the contents of which can be found at:

http://www.barrettcommunications.com.au/pages/acc-interferance-kit.html

I'm sure Codan has a similar thing, but I would guess it would be about double the price!!?? Anyone had any luck with these or is it just a wast of hard-earned $$? Perhaps the parts can be purchased separately cheaper?

I suppose the biggest problem is that my knowledge is less technical than it needs to be to really nut out the problem and I may be just grasping at straws.

Mark

Mark I understand perfectly, its a bit like me with mechanicking.
When replacing a clutch in my 4wd a few years ago, I had to admit
that I had never seen a clutch before!
Simple solution. Find out what makes the most noise. Do it step by
step, one at a time. There's usually no easy universal fix, despite
the Barrett kit. You could end up paying a packet for bits worth
perhaps 10% of their cost. Then get back to this group. There are
quite a few knowledgeable techs here who would point you in the right
direction. Tell you what to buy, where to buy it and where to put
it :))
Cheers
Jim

Sorry if this question has been asked before as I am new to this group - has anyone noted the difference in the performance between the whip antenna and the rigid antenna. Mine is installed on the rear wheel carrier (DCE homemade bracket - 15 degress). I have tested it in various locations and have noticed no difference in performance except out performing the Barrett on a recent Cape trip. The Transceiver is a 9323.

Hi Dale and welcome to the group. Not sure of what you mean by rigid aerials and whips. Autotunes and whips? Which ones? (there are different makes and models of both). I use both from time to time but as I make my own whips I'd be biased:))
How did you enjoy the Cape? Corros still as interesting as ever ?

Cheers
Jim

Ah got it now. Haven't heard anything about the differces in performance between the steel and fibreglass tops for the atu's. I know the old steel top with a coiled bit was relatively easy to break. Some of the earlier fibreglass tops tended to get water in them and that would certainly affect their performance.
Glad you enjoyed the Cape. It's quite different isn't it ? You'll have a lot of traffic on the Simpson by the looks of things. I know of a few groups that will be in that area around that time. It's getting more like the CSR every day :))
Cheers
Jim

Yes I am quite familiar with the coil top antenna - mine lasted 10 months before it was replaced by Codan under warranty within 24 hours with one without a coil.

All,
apart from length and not needing a spring;

The wire whip will not tune below about 2500 khz.
The fibreglass whip will.

Hi,

some 9323's came with the GPS option already enabled, but a friend
who has an early 9323 without GPS said they want s ridiculous amout
of money to enable it.

Mine was enabled when purchased and was simple to connect to the GPS.
I can send my position on any channel to any other 9323 with GPS
option enabled. I can also receive positions from other users or
request their position all by special selcalls.

Cheers

Nigel

Hi,

I have the australian made ERPS system on my GQ Patrol petrol and did not notice any extra noise on my 9323 after the ERPS was fitted.

I beleive some other brands or rust systems may actually pulse rather than mantain a constant voltage, so these may cause problems similar to what the megapulse of Toyota 100 series deisel pump does.

Cheers

Nigel

Not bad for an option enabled by entering a few numbers, calculated off
the serial number!

The mod only enables AM on transmit,
you still only receive in Sideband. This is not a problem as the audio
is acceptable enough.
The radio will just filter out either sideband depending on what you
have selected (LSB/USB)

Cheers
Ben

g'day all,
having just joined this list and seeing a topic hot to my ears,
i thought i'd ask the question.....
does anyone know how to enable the gps function on the codan 9323 ? can it be done by us (like programming channels etc) ? or is this solely a ' back to codan ' job.
i know you can send it back to codan to be done, so replies only if can be done privately, and/or how please.....

Paul,

The Codan dealer needs to send the Electronic Serial Number to Codan, who will send back a password to enable the GPS interface.

They can enable it from the front panel, so the radio does not need to be removed.

Yes, they charge, but have to recover the cost of all those software engineers somehow :-)

Interested in your reference to a "worn" 9350.

It has a 3 year warranty, and will be replaced as long as it has not been abused.

Hitting something is abuse, but internals failing without physical damage gets you a new/repaired antenna, I believe.

A drowned 9350 means the warranty is voided, of course.....

My $0.02 worth

mr hf guy, (whoever you are)
thanks for that info, i didnt know they had such a warranty. i thought just the usual 12 mths etc.
yep, has developed tuning problems. no abuse (other than use)
basically for the first 18 mths or so, i had a scan table with telstra rdd, and vks737 radio network frequencies on there, and it picked the 14meg freq as its tuning freq for scanning.
now has heaps of probs tuning on that freq. probs on other freq aswell, though infrequent, however the 14 meg one is (nearly) all the time.
i will get the 9350 looked at anyway (hopefully it will be covered) do i have to send aerial back to codan itself for warranty to be looked at? or a local dealer ?
i have access to the programming software for the 9323, i take it this will not help me to enable the gps function? do i still have to take it to a dealer?
TIA,
regards,
paul lefevre

Paul,

1. The Codan Service Centre can be contacted on 07 337 32333.

They send it to Codan (Codan have moved spares/warranty work to Brisbane), who decide if it is a warranty job, and whether to repair or replace it if it is.

They pick up the freight to and from the factory.

I would certainly check earthing before I went to the trouble of taking it off, however.

A good idea is to check all earthing on a regular basis, as earthing ends up in the "out of sight, out of mind" basket, and it's a very important part of the total installation.

2. You need factory programming software to add/change options, and it never leaves the factory!

Typo alert. The 9323 is of course the tranceiver. I meant the 9350 autotune.
My apologies, thats what comes from late nights :))

Cheers

560. VKS and VMS

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-06-27 06:08:13 UTC
From: tuningdifficulties
Topic: 344 Message: 560

Hmmmmmmm.... Why was "VMS blamed?"

VKS Chairman is a Barrett dealer.
VKS Vice-Chairman is a Barrett dealer.
VKS Vice-Chairman also makes antennas.
Barrett is a VKS sponsor.

VMS is run by the guy who supplies antennas to Codan.
He also runs the BushPhone direct-dial telephone service.
He also runs Radiodata, which uses all Codan modems, as they are much faster than what Barrett buy (Pactor).

He is not a Codan dealer.

Call VMS/BushPhone/Radiodata and say that you want to connect to their service, and they take your money, sign you up and arrange for your Codan or Barrett to be programmed as necessary.

VKS will not be mentioned.

Call RadTel (Codan and Barrett dealer who runs a competing direct-dial telephone service) who are recommended by VKS (funny, that) and they will do the same as BushPhone.

RadTel and Bushphone don't say bad things about each other.

Call VKS and ask to put your Codan on to the service and get told that Codan radios are rubbish, and hear absolutely vitriolic rantings about VMS.

It also seems that every time there is some noise on the recreational frequencies that VMS/BushPhone/Radiodata/Codan get blamed by VKS operators.

Remember, the VKS Chairman is a Barrett dealer.

You can draw your own conclusions - we did.

It's time for all of this to stop, and the paranoid ones get a life, but past experience suggests that it won't happen.

So, we use our "rubbish" Codan NGT (must be something wrong with it, as you turn on the Easitalk DSP noise reduction and all you can hear are voices, where our friend's 950 has all of this background noise almost blocking out the voices) on the VMS service offered by the people who ruin VKS' channels.

We joined VMS basically because we were staggered at how VMS and Codan were abused by VKS, and we hate advertisements which are based on running down the competition.

Gee, I feel lots better now :-)

George

From: markeaust
Topic: 546 Message: 561

Jim,

With a friend of mine a few years ago, we built one of these aerials, as per these instructions. I have dismantled it due to the sale of land etc, but have uploaded a photo of the balun and coils/resistors for the loading networks. We used simple PVC containers/tubes and the like to house all the goodies.

As per the article, we used 2.5mm 7 strand copper earthing cable as sold for household earthing applications (though we had to get the green insulated variety). The spreaders were made from PVC tube and nylon cord was used as support. It worked very well indeed even strung up at only about 8 metres with SWR less than 2:1 across the 3-24 mHz with a couple of little SER 'spikes' where I didn't care. It was interesting attaching it to a coax switch and whilst receiving and then switching between the autotune and the dipole. It is a different world!

I plan to build this antenna again and am considering using the stainless steel cable as used by Bushcomm (75 c/metre) and perhaps even order their fibreglass spreaders ($5 each) as I now have somewhere to put it up again!

Speaking to the guy at Bushcomm, he reckons that the copper wire will eventually 'tarnish' and introduce additional noise into the Rx signal, thus reducing performance...mind you he wanted to sell me one of his. Any idea whether the stainless will perform differently to the copper? Will any of the components need alteration?

Thanks again for the info,

Mark

All,

I'm with VKS and have been since 1993 (Victor 3). I have a Codan and have no interest in the politics. Recently went with Bushphone+ as I thought their offerings were just a little better than Radtel...however if things change I will go where I get the best quality service. Suits all my needs at the moment...but as soon as those needs change.....

Couldn't care less who was blaming who and who was huffing and puffing!

Mark

ps Have heard about how good the 'Easitalk' function is but haven't had the chance to play with one!

Hi Mark. I have built numerous HF and VHF aerials over the years but not this one. I did have a 3-30 meg commercial aerial once for amateur use but found it disappointing. Signals were way down on a dipole.
Thanks for sharing your experiences. I intend to buy/build one for myself, but not if the signals are appreciably down.
Yep, the radiation and capture effeciency of the autotune and a decent aerial are marked. But when off the track I'm happy to have anything that will get through :))
As for coppor wire weathering, yep. Introduces noise into receiver? Only if connections become less than optimum. I have yet to read or be told anything else. I suspect that the company you spoke of is comprised of technical people and BS people! Guess which one I think you spoke to? :)))
Cheers

The politics are an interesting talking point for some. I guess the limited market combined with personalities and egos make for an interesting time in both camps.
But in the end it's about giving us, the users, what we want at an attractive price.
Competition should be a good thing because all parties have to try harder to capture our dollar. Slinging matches by any party may prove to be counter productive.
I know in my case I'd probably show my distaste by walking. But thats just me :))

Cheers

G'Day, one for the other side here..:-)

No paranoia either just happy to continue with the largest 4wd radio network in Oz and I see no reason to change, the operators I have spoken to over the past 3-4 years have been totally professional and not once have I heard them bad mouth anybody, even the idiots that talk over the skeds and send annoying selcalls when skeds are on are ignored or at the most are politely asked to cease, come to think of it during my time as a VKS member I have heard only one instance where a Bushtelegraph member called into skeds and was politely told they were unable to communicate with him after asking if everything was OK.

I dont use radtel/bushphone so can't comment on whats better in that regard. I never did understand why 2 different HF mobs were allowed to use the same frequencies....seems things would have been simple if all operated on different freq's.

Cheers

It's easy, we automatically go away from anyone who slags their competitor, and check out the competitor.

It's that Christian upbringing, I guess :-)

Easitalk really pulls weak signals out of the noise, and it's better than a couple of external units that we tried on our old 9323.

It doesn't make any difference to strong signals (maybe degrades it a tad if it's REALLY strong), so we only turn it on for noisy ones.

Now, if only it could kill the electrical noise that my mate's Range Rover makes!

Later,

George

I finally finished installing the 9323 in the Diesel Landcruiser (100 Series) yesterday, nearly 12 months after buying it. I was getting a little worried if it would pick up electrical interference noise or not, but am now proud to report that after taking it for a drive there is no noise level difference with the engine on or off. Still need to finish earthing the antenna tuner properly but otherwise appears to work well.

Brian.

Brian, have never heard of anyone having huge interference problems with the L/C before. I had an oil sender unit in a 60 series that was slightly noisy but nothing in the 80 series. I'm pleased to hear that the 100 series also seems immune. Now if only I could win lotto ....:))

Jim
I run a 92 model 75 series trayback. I also just as a point of interest when tripping I run an Evakool ED70 model fridge (made in Australia). These are low current draw 2.5 amps@12 volt units. When the fridge motor is running there is a noticeable interference coming through the Codan but I can hack that as the Codan is mainly on scan anyway during the day while driving. One trick I will be looking at is the inline DC filter (D5390) that is fitted in the DC cord to the Codan. There rated for 18 amps continous and 20 amps peak. I have not seen the product as the nearest DSE (http://www.dse.com.au) store is a hundred and forty kays away. A similar product is available from http://jaycarstore.webfactory.com.au/ Cat. No: AA3081 (rated at 40 amps) but seems more applicable to petrol engines. Nearest store is six hundred kay away. I am more inclined to go this way as http://www.amcominc.com/productdetail.cfm?Prod_ID=16 but it seems expensive for a product I have not heard how it preforms and is made in a far away land so if it is not up to expectations there is a problem returning it for my money back. I did email them but they replied they were looking for an Australian distributor.

From: hz180
Topic: 577 Message: 577

A friend has a 92 model 75 series diesel trayback.(Not quite an 80 but it will have to do :). He experiences heaps of electrical interference in his Codan. He's tried the usual cures and is contemplating some unusual ones.
I havent experienced almost any vehicle generated interference in either the 80 or 60 series diesels. Is the 75 series diesel fundamentally different in some electrical way ? Anyone else know of such interference in these vehicles ?

Cheers
Jim

Graeme,

There have been many previous posts on noise suppression which are worth looking into. I also have probs in this area and have found that a calculated approach to solving the problem is appropriate.

Start off by looking at this website which should help to determine the CAUSE of the noise.
http://www.k2bj.com/Pages/Noise/Intro.htm
You need to find this out before spending lots of money on fancy little filters which may do absolutely nothing. The noise must either be coming in through your DC feed, the coaxial cable or antenna as radiated noise.

All the grounding you have done is a good start. Something I have just realised with my car is that the earth between the bullbar and chassis is poor, due to the powder coating etc. Also earth the bonnet to the body and thoroughly earth the body to the chassis. Double check that all original earth points are clean and have good electrical contact etc....

Some radiated noise is very difficult to solve without major surgery such as shielding of various cables and components and perhaps adding various types of filters. The problem with filters are that there are so many different types, that without very technical knowhow, it is very difficult to know which is the correct one for the particular application....

I am continuing my research...

Cheers,

Mark

Gday all,

Broke my SS whip [the early version with coiled end] again, and sourced a replacement [newer type, thinnner and more flexible, I've been told]....I contacted a Codan distributor here in the West to be told I can only order via Brisbane, at $75 plus GST for whip, $15 postage....Bugger $97.50 seems excessive for a piece of SS wire !!!....so I went and bought 1.5mts of SS wire for $4 with the intention of making my own....Previously when it broken I just welded it back on, BUT this time I had the bright idea of heating and coiling it around the nut, suffice to say it didn't work exactly to plan as the heat softened the nut too much and the wire protruded through.....So back to Sq 1.....anybody have any idea's...Any UHF or CB types wire whips fit the auto tune? How about Barrett wire whip with thread adapter?

Now $101.50 for a piece of wire, counting my attempt....sheeeesh...

Mick,
On my HF (older 8558 a/tune) I use a stainless steel whip from RFI
(around $10) and just make up a brass adaptor.
Polar sell a whip with an inbuilt spring for a similar price, still need
an adaptor.
The local machine shop made me up one for $5
Your local radio shop should be able to source the whips for you.
with the non coiled whips, try a piece of rubber sleeving over where the
whip meets the threaded
base to stop any vibration breakages. I beleive Codan went to the non
coiled whips as they proved stronger.

Thanks Ben, $15 seems more like the price I want to pay, Now some more questions,
I take it RFI & Polar are brand names?
Would Dick Smith or Tandy be the place to check these out?
Is the length of the SS whip critical or does the auto tune compensate?

Cheers
Mick

Mick
RFI and Polar are companies that sell commercial antennas
I doubt very much if DSE or Tandy would stock them. Try a shop that
specialises in
radio repair/install. preferrably commercial stuff
You need to get a Mid band VHF whip. THey are around 1.2 mtrs long.
The autotune will compensate for the length, but like the original, you
wont tune below around
2.5 mhz
What state you in Mick, May be able to point you to a source

584. Oil Sender

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-06-29 11:53:10 UTC
From: tomc99302
Topic: 584 Message: 584

Hi All,

Just wondering what others have done to cure the interference caused by Oil Senders beside just unplugging the wire. I've tracked my interference problems in my petrol 60 series to this after being sceptical that something so relatively insignificant could cause such a big problem (seemed to peak at 8 meg - right on VKS Ch2). I tried earthing panels/bonnet etc (probably a good exercise anyway) but couldn't decrease the "hash", but noticed it always took a couple of seconds to start interfering after starting the engine.

Any tricks?

Thanks,

Tom.

Hi Tom. Had the same problem in my HJ60. Cured it by replacing the
oil sender unit. Mech said contacts get yukky over time and start to
cause interference. If that doesnt cure it, a filter on the output
could fix it. Try various values of capacitance etc .
Cheers

Thanks Todd, I gave them a call and have ordered one, Spoke to helpful guy named Peter, the $41.25 is for an aftermarket brand, $50 still buys the genuine codan, but he recommended the 1st as they tune down low.... they are sending over night freight for the cost you quoted,

The price I was quoted here in WA was pure and simple a unreasonable markup.

Thanks for all help/suggestions

Whilst we're all on the subject of whips....I thought the orig codan one would break sooner or later, so ended up buying both the Barrett whips and having an adaptor made from brass, then chromed ($10).

Even though the Barrett whips were not el-cheapos, the larger of the two has a built-in spring and is quite a bit longer than even the big black whip supplied with the 9350. Works very well indeed! The Smaller Barrett whip has no spring, but a cheap CB type spring can be adapted for the purpose. This smaller whip is also much thinner and more flexible and can be tied back for a sort of NVIS operation and vwhalla.....it fits in the garage and under low trees etc....

Hopefully I will NEVER have to buy another whip!

Cheers,

Mark

Thanks Jim,

but thats the problem the case has been damaged (salt water) I was
wondering if there was any other way to try to figure it out.

Just a further note on ss whips. Went down to the local metaland shop today and got 2 meters of 3mm stainless steel. Will modify it to go into the base of the broken old codan whip and cut it to about 1.6 or 1.7 meters. Replacement steel cost 4 dollars

Graeme

Copy Cat !!! Though thats a good deal, my SS whip attempt cost me $4 for 1.5 mts....

My SS whip from Brissy turned up today, ordered it Monday.... stuck it on & called up some mates around Alice..bewdiful $41.25 for whip and $16.50 freight..Im happy.

Cheers

Thanks Jim, it's an A

Also on a different note I picked up an 8555 autotune antenna today.
I have never heard of and 8555 looks a little different to an 8558.

Has anybody got any info of these or any idea what I need to make it
work with my 8525A.

Thanks all

Col

Col, glad it helped. The 8555 sounds like an early one that might of been made by Moonraker ?? You will almost certainly need an 8551 control box between the 25A and the atu. These aren't easy to find, and I have paid $100 for one in mint condition. If the 8555 uses the same control plug as the 8558 then ditto.

Cheers
Jim
PS Did you buy this stuff from a guy in Sydney that had it in his garage ?

G'day Andrew,

Mk 2. HF Aerial mount.

my autotune is mounted between the Kaymar wheel carrier and the tailgate, I have the Kaymar and 2 carrier's, so i was not able to make a bracket of the type that Kaymar sell that mounts to the swingarm of the carrier, also with the larger tires i use I couldnt use the Kaymar HF bracket that mounts between the tire and metalwork.....So I used the square mounting brackets that Kaymar use for the worklight, got myself some SOLID square steel of the size that slides into the brackets and welded on a flat piece of steel for the aerial to mount on, to get the aerial to not foul with the 285x16 tire or the tailgate I put a slight S bend in it using a press, powder coated it and it looks good.

As long as you dont reverse into trees and bend the carrier back as I did on my previous Kaymar there are no problems...Oh as long as you remember the aerial is connected when you go under servo's or home garages....;-))

Mk 1. was mounted on rear of Kaymar, didnt like it as I felt it was too exposed also PITA having to remove and unplug when changing wheels.

Mick

Jim,

I traded some repairs to a tait UHF mobile for the atu with a mate of mine.

Why do you ask?

The atu as you say is made by moonraker is it worth my while looking for a control module or just sell it ???

Col, The gear sounded like some stuff that was for sale in Sydney
last week.
I would look around for an 8551 before selling it, not sure they'd be
worth too much anyway.
Cheers

Sorri about that Mick in West Aussie

The way I look at it is I will be going bush again and it is going to get broken/damaged so I really can not see the point in spending more bucks. The price of some the Codan parts are getting expensive like ham radio gear, but I am happy with my Codan as it suits my purpose. One major advantage is some ham gear has to go back to the distributor in another state for repair where the Codan can
be repaired locally if needed.

Your not related to mOrAn mOE are you...? LOL

Yep, I know what your saying about the costs & service etc...but I was happy in paying half the quoted price delivered than what I could have got locally, for list info, it was a bushcomm 9350 1.6mt whip.

I have an emergency aerial that list member Jim makes, should the auto tune stop working or I break/damage my whips, I have that as a back up.

gday

I had the same trouble. Went to DICK SMITH and purchased a circuit etching pen around $35, removed the front membrane carefully and re etched the open circuits, easy and stress free and bingo it worked again.

cheers

I take you mean a conductive type pen ???

I had a look at your idea if thats what you mean,
don't know how it will go on my radio as the break in
the track is on line 1 (Pwr, Scn, and the Mutes) but
it's broken in the sealed section of the membraine
where it does the 90deg turn from the front pannel to
connect to the display board.

I need to bypass that section of the track, I have
done it at the moment with a short bit of wire but I
would like somting a little better.

Also the Codan on VKham bas been sold.

Thanks All

Col

Whoppin.
Perhaps you could talk to your 'contacts' at the service centre
and publish a list on their behalf of what old codan spares they
may have for sale.

:)

Chris, was the aerial mounted on the back ? They hide there and kinda
sneak up on all sorts of things. :-)
Was the steel whip top ever intended to tune to 2020? I thought only
the fibreglass whip went there.
I know my 8558 and f/g whip has no trouble on 2020. Although unless
wanting the RFDS direct whilst in the Simpson, personally I wouldn't
bother. Still judging by your post 2020 may have uses that I am
unaware
of.
Cheers

Gday Chris,

I was told they were good enough to tune all frequencies..i was recommended the bushcomm over the genuine codan...I will try 2020 out tomorrow.

Bugger the bust..ouch. I was hoping they would be flexible enough to handle some branch hitting.....mine sure seems bendy enough

Gday

I have purchased 2 x 8551 interface boxes, both look in good nick if anyone interested, I will probably offer them for sale in the coming weeks.

cheers

The 100 series TD is just as noisy. I've got a mate who's
paid the local Codan dealer hundreds to try to make the noise
go away and still no luck. I've printed out all the posts with
suggestions for him to try.

Cheers

Hehehe ;-).....done that on 2.4mt garage clearance, not much I could do other than reverse out..the large spring on the FG whip was bent over at right angles....survived it ok, though more bark was taken off the whip so i ended up buying some heat shrink and recovering the whip, couldnt find any glued heat shrink so resorted to 'normal' heat shrink.

Cheers

Hi Ben - no it's the Bushcomm whip not the little Codan whip. The Bushcomm man said it ought to tune down there ok, but even mounted on the Codan spring base it won't get there. Do I really need 2020? Probably not, but it annoys me to have a frequency in the radio and not be able to tune to it! And one I can legally use, too!

The B'comm whip's been pretty tough - but it was one of those late-in-the-day, tired and just wanta get out of here, bugger-the-branches, situations. I missed seeing one in time to slow down, and I really wrapped it around the branch only a couple of inches from the base. Can't blame the design or the quality - just abused it a bit too much. Performance has been good too - talked Cape York to Perth through it last year.

I've still got one of the old 9-foot stainless 27meg cb whips from the '80s out in the shed. (Remember them? Who's game to admit they used to drive around town with one of those on the back of the car?) I might see if I can make up an adapter to fit it to the Codan spring base. Nine foot whip on top of the 9350 base - that will be one for the open country I think! Should drag in the signals, though!

From: just_an_hf_guy
Topic: 627 Message: 640

... cannot be changed :-(

The fibreglass whip tunes down to 2MHz (mine works on 1.820MHz with a big bulldog clip on the top) or thereabouts.

Changing to the shorter whip means that the antenna is shorter as a function of wavelength, so it cannot tune below 2.5MHz.

Skin effect doesn't matter when they are so electrically short, so changing to a skinnier whip should make no difference.

BTW, their Near Vertical Incident Skywave (NVIS) whip seems a couple of metres longer, and the WWW site shows operation from 1.6 to 12MHz because it is now too long.

My $0.02

641. Codan 8121- any info out there

Hi all,

I have a friend who has an codan 8121Marine HF, has marine and RFDS crystals fitted, they are similar to the 6924 portable transceiver with built in antenna tuner . The build date is 1982.

Does anyone out there have a manual or info on these rigs? Particular after the mute circuit and the emergency tone generator(for RFDS) . any crystals lying about gathering dust??

regards

Paul

Top loading?

> Changing to the shorter whip means that the antenna is shorter as a
> function of wavelength, so it cannot tune below 2.5MHz.

Whether the unit will tune with a paper clip on 2 meg is a function
of the length of the whip and the design of the loading coil. Enough
L and you don't need much C. I take it you were assuming that we have
the maximum inductance in circuit here.

> Skin effect doesn't matter when they are so electrically short, so
> changing to a skinnier whip should make no difference.

Yep
>
> BTW, their Near Vertical Incident Skywave (NVIS) whip seems a
couple
> of metres longer, and the WWW site shows operation from 1.6 to
12MHz
> because it is now too long.

Too long ? The function of the loading coil is to compensate for the
lack of length (in wavelength terms). It will also within limits
compensate for any extra length. It can only be too long if we are
talking about the same value of inductance at the same frequency.
I suspect that some of the extra length of the NVIS whip is to assist
with tying the whip to the vehicle to achieve the different take off
angle.

Beware the Am mod for 8528 do not use on CB unless you like to break the law as it gives 30 to fifty watts out of carrier how come the PA does not blow up like the power mod for 27 28 meg describes
As the mod bypasses the low power strap it should be used for amatuer only also the low power mod is unnessasery for use on 28megs will not hurt the PA at all was only meant for KIT with LSB crystal to go CB channels where the output should be 12 watts and that is the only reason it exists not because the PA will fry

1.820 is an unusual TX freq to have in your set. must have had some
pretty fancy software
to program the EPROM? (standard is 2mhz upwards...)

or do you mean it tunes on RX at 1820. The autotunes just drive the
stepper motor to the top of the
coil for rx freqs.

Seems a few questions have been raised lately..
Hopefully someone in the know can answer this for us all.

What was the real reason for the fitment of the Low power strap in the 8528's

a) Legal TX power on 27mhz CB SSB?
b) Reduce spurious transmissions on freqs above 24mhz (after all the filters are marked
only up to 24meg on the circuits)
c) Prevent filters in the PA frying (same reason as b)

I was led to beleive it was c and partly b and have been promoting the fact on my site.
If incorrect and the '28 can handle full power above 24 mhz, we will have some happy amateurs out there....

Ben

Just been down to the local phone shop here in town enquiring about sat phones. When asked about the foot print of the sat whether it had a 100% coverage of Australia the sales attendants reply was no. He further stated that some travellers that go outback have reported there sat phones will not work in certain areas (did not give specific locations). I did not ask about running costs. Makes that radio network look more attactive and more depndable even with all the modern technology.

I've also heard of 3 other problems with satphones.
a) not always accessable
b) if you cant see satellite you cant get it eg. valleys in Vic etc
c) don't work too well under the tree canopy (Cape York etc)
A friend hires them out so I'm not going to mention the expenses :))
Be happy to hear from anyone who can dispute the above reports.

Cheers
Jim

The reasons stated below are correct. The reason why is fairly simple. Simply because the frequency of a Sat Phone (from memory about 1.3 GHz) is a direct line of sight type radio wave. Add to this the obvious distance the radio signal needs to travel (to the Satellite which is in space orbit - not on the ground in frot of you). This simply means unless you have a CLEAR line of sight with the satellite, you will have difficulties with signal. i.e. tree cover blocks the signal which is obviously weak with the distance it has to cover, and being in valleys shades the distance of coverage you have. Think of yourself being in the bottom of a funnel. You can only see a certain part of the outside world above you. However if you climb up to the top of that funnel you can see a lot more of the outside world.

Brian.

Depends on weather you are using optus mobilsat or globalstar.
they use different satellites.

In NSW at least there is an exclusion zone around Coonabarabran for
Siding Springs observatory for all satellite phones
Between Tibooburra and Camerons Corner, Globalstar drops out as its on
the
edge of two sat footprints.
Running costs are not cheap, plan prices vary like GSM/CDMA mobile
phones

It all comes back to convenience, security, ease of operation and price
as
to which way you prefer to go. Me, I'll stick with HF

Ben
You bet you'll have some VERY HAPPY hams if 8528 iz
capable of full power over 24 Megs, but, anyway, I did
Lu (Argentina) from Belgrade few days ago with only 12
watts using simple Windom on 28 Megs (RPT was 57-58).
Codan is the best.

G'day all,

Just a quick intro to myself.
My name is Ari Palsson, - I am new to the list.
I own the CamperTrailers list and when asking questions about HF radios, some kindhearted members on my list pointed me into this direction :)

I see that there are quite a few familiar names on the members register here.

We don't have a HF yet but are looking to purchase one within the next 6 months or so.

The main reason is that we do increasingly long outback trips and believe that when the option is either a HF or Sat Phone, the HF seems the way to go.

Regards

Ari Palsson

G'day Ari and welcome. You'll find some interesting and knowledgeable people around these parts. Have a peek at previous posts which will answer some questions and probably raise more.
Don't be afraid to ask, not everyone is a radio "expert". Even those of us who have some experience in these matters can always learn.
There has been some recent discussion on satphones, and the consensus seems to be that HF is still the way to go for many of us.
Don't forget that if your travelling is only a few weeks here and there that HF radios can be hired.
Feel free to fire off any questions.

Cheers
Jim

I concur with Ben on the costs, but as I only have experience with departmental phones (OPTUS & Globalstar.), which I don't have to pay for, that side is then mute.

Ben Hobson wrote:

That's interesting, seeing as how Siding Springs observatories are all visible
light observatories (Infra Red to Ultra Violet.) and not RF based like Parkes,
Narrabri (Top of Yarrie Lakes.), Tidbinbilla oops thats a NASA Deep Space Site.

>
> Between Tibooburra and Camerons Corner, Globalstar drops out as its on
> the edge of two sat footprints.

We also get problems due to areas of soil and rock with high levels of magnetite
or ironstone, this also effects HF as well. There are a few around the Gulf of Carpentaria,
Mt Isa, Cloncurry, Richmond and Charers towers. From workmates up in the Cape area,
they also have some locations with the same problems, Iron range, Weipa and some others
that I can't remember.
So no comms at all in some locations, same thing happens in WA and SA, this from some
ex Sand gropers and crows I work with.

Same here, also Globalstar doesn't work too well offshore as some of my workmates

found when testing some new equipment for company vessel.

Regards,
Sam

Not sure on the reasoning behind that Sam, but when we had a work
repeater station at the observatory, we had to turn it off every time
they wanted to look at the stars, It interfered with something there.
As you can imagine we we relocated our equipment pretty quickly..

HF_user,

I am even more frustrated now as I have just got off the phone to the local dealer who wants between $130 and $200 to add the 27Mhz marine, Radtel and Bushphone frequencies. They will however upgrade the firmware and save my profile to floppy free of charge. Some consolation, hey.

Regards,

Barry.

Whoppin,

Thanks for the info. As I am in Alice Springs and these prices were from the Codan service agent but $66 is a damn site cheaper than the minimum $130 quoted.

I guess I will leave it until I get away from the captive market syndrome that this town is built on. Short term I can live without them but will get it done next time I visit Adelaide or the East coast.

Regards,

Barry

Ben

I think that real reason for using the Low power strap
is in b) as you wrote. I have test it - during the
transmission on 8528 (on 28.450 Megs - 12 Watts) I got
RFI on my Kenwood TR-751 2m radio up to S9.
Transmiting 8528 (with 100 Watts) on 21.250 Megs there
was not any RFI on Kenwood. Things are clear - filters
works only up to 24 Megs.

From: lyndsay
Topic: 677 Message: 677

Yes the transmitter is only rated too 24mhz will the full capability of the radio at 28 mhz 50 watts maybe Kill the PA ?
The output may just need filtering no danger to our PA?
You would still need the low power strap for CB to meet regs on pwr
Or the PA will fry and no one wants to do that

Ari,
if you go to the groups homepage and look in the photos section
I have posted a few pictures of such an idea
basically 2 bits of 100 x 75 RHS to space out the wheel carrier

Hi Ari, many times has this subject come up and there are many vehicles fitted with mounts between the back door and the spare wheel. The ones I have seen here in Townsville are as Follows: Patrol, Landcruiser HJ75/HZJ78, Discovery, Prado , Pajero and Jackaroo. Mind you these are all either NDC (Network Design and Construction (Used to be part of Telstra.)) or TELSTRA vehicles.
On further inquiry, mainly because my work is looking into it as our transport section is starting to buy bullbars which can't take big antenna's, it turns out that these are supplied by NDC or TELSTRA to the contractor/company fitting the vehicles with HF. They aren't marketed but made by some company on contract to NDC/TELSTRA the location of which is either in Sydney or Melbourne, due to packing slip info obtained from one installer.

My boss would love to fit a couple of these on some of our problem vehicles but as we can't find the manufacturer and because of the probability of an "Exclusive Supply" contract they would have with NDC/TELSTRA, back to the drawing board. We also need ones to mount a Codan 9350 on the rear drivers-side quarter (Above tail light) on Ford AU III utes with an FRP canopy fitted. Tough job.
Regards,
Sam

Hi Ari,

In the NT, although it is not illegal yet, there is a big push by the MVR to ban the mounting of autotune antennas on bull bars. The MVR are pushing a 30cm above bonnet height restriction on autotunes so if it can be mounted on the lower section and still comply with ADR, it would be ok but most antenna mounts are on the top bar.

I have uploaded some photos of my autotune antenna mount fitted to my 98 GU patrol. I had it made at a local engineering shop from 3mm galvanised sheet then powder coated. It is mounted by removal of the spare wheel carrier bracket, a piece of 3mm rubber matting between the door and antenna bracket then spare wheel bracket bolted back on holding it all in place.

I have three issues with my setup.
1. When travelling on rough roads, the antenna gets a bit of vibration and the bracket tends to bend hence the fitting of the rubber stop so it can't flex too much. I could also add another support backet under the spare wheel but at the moment it is okay as is.
2. With a 50mm lift and normal packing of the vehicle, the height to the top of the autotune is 2300mm. If I take the fridge and shelf kit from the car, the height is around 2350mm. The problem is my car port is only 2330mm so I can't use the carport when the car is empty.
3. Being mounted at the rear of the car, you dont have a visual of the antenna so when travelling on rough roads I constantly check the mounting bolts and whip extention for tightness.

That being said, I have had this setup for 3 years now with trips across the Simpson, Tanami Track, Gibb River road, Coburg Penisular and Odnadatta Track plus many local trips without any issues.

Since fitting my bracket, I have seen a bracket on a GU made from 6mm steel bent at 90 degrees to the door at the top and angled at the bottom to bolted to the top of the wheel carrier. This was on a tour guides patrol which had done thousands of Desert track miles with no problems. Although both have serverd their purpose well, the 6mm version was a little simpler ie: 2 bends and 3 holes verses 3 bends, 5 holes and a bit of welding. Also the 6mm version doesn't suffer the flex problem I have with mine.

Hope this helps you find your solution.

Regards,

Barry.

You haven't been overly specific lyndsay however the 8528 had an option where you could freetune to any freq from 2-28meg and input TX and RX into a P channel....Option TX-E. It is quite uncommon however some people have got it.

Craig
(with sick 8558 autotune).

After looking at your pics I can see why you□re concerned. Codan specify 10mm for mounting brackets which IMHO is a tad over the top, however I have 5mm which has bent slightly under the weight of the 8558 on corrugations.
6mm is probably the best choice and even then a gusset would be a wise investment to take the flex out of it. Welding & steel is cheaper than an autotune.

Personally I thing you should try a mount off the centre of your wheel ala Kaymar which is a bit of a pain when you□re need to change tyres however brings the aerial down a bit in height and allows a stronger mount.

Best described as a plate drilled to to the spacing of your spare wheel mount onto which a square section is welded and a plate welded onto of this for the aerial to mount on to.

Lyndsay,
Craig is correct about the TX E option. It's just an easy way of entering new P-Channels
without having to short the microprocessor link on power up. A free tuning on TX Codan would
be very nice, however it could also be dangerous in the wrong hands....
Are you suggesting an EPROM hack to make this happen ?
It would be nice to know a little bit more about the workings of the firmware.

Craig > check the transistors on your option AD board. they shouldnt get hot while tuning.

Ben

My 8528 is with Tx E option (according to display if you push "On/Off" in work). In spite of that, I have to short the microprocessor link on power up if I want to add new P channel (I put little switch on the back side now). Changing original EPROM to Amateur profile one, I have got Rx/Tx on all ham bands. Option now is Tx E-A on display. Ben, don't resent me, but story about stations as very dangerous things (worse than guns) was very popular during communist regime here - idea was not to communicate with anybody in the world. All hands, except theirs, was wrong ones.

Sorry to be so obtuse but as Ben suggests it would be VERY dangerous in the wrong hands but I found the channelised operation of these radios to be restrictive mostly for horribly off freq radios the need to tune rx each time is a pain I thought it would be nice to free tune.The TX-E i have already,and it is not much better so I was wondering if any one had done this already as I felt it would be nice.
So if no one has
do you want it?????

Date: 2002-07-21 10:10:07 UTC
From: tomc99302
Topic: 692 Message: 692

Hi All,

Just wondering if anyone has any radios they use for spare parts, and hopefully are willing to sell me an IC.
My 8525A has a problem in that it constantly turns the signal amplifier in the autotune on, regardless of whether it's in scan mode or not. In the 8525A this seems to be done by an SAA1064. 8525A and 8525B have 4 of these IC's (2 on the micro board and 2 on the display board) and the 8528 has 2 of them (2 on the microboard).
For now I have connected a switch to the antenna control box (8551) to switch the signal amplifier on and off manually, but it's only a matter of time before I forget to turn it off before I transmit and blow the amplifier - something I'd like to avoid.

So please, has anyone got 1 SAA1064 they would be willing to sell?

Thanks,

Tom.

Thanks Ben,
Still habven't gathered up the energy to go looking, but I must get the radio side checked before buying a new autotune.....however it won't tune even from cold. Funny thing is the autotune worked all the way across the desert however failed when I washed the dirt off at Yulara.....it stopped working that day.

It tries to tune but doesn't settle just fails....and I just had it going nicely too after doing the 8558 mod for my 80 Series.

Hi Barry,

Thank you for the pictures and explanations.
This looks very much like the kind of a mount I would be interested in fitting.
There are two main reasons:

I don't like the idea of the autotune on the bullbar, because of both potential legal issues and how it blocks vision.

Secondly, I am hesitant to space the spare wheel back from the door because I have oversized tyres on the car (more weight) and already have issues with seals and risk of cracks from vibrations when driving on corrugations (which I do a lot of)

I know an engineering firm that no doubt would make me a bracket like this. 6mm thick with little gussets in the corners for reinforcement should be pretty strong.

Thanks again and to all that responded.

Hi Craig

9350 Antenna? Mine had the same problem you describe. Check the rubber tube that joins the stepper motor to the worm-drive shaft - mine was slipping. I added a pair of very small hose clamps, and that fixed it. Don't use a different rubber tube - it's special stuff.

Enough dollars and you can buy a tranceiver and a linear that will cover 3-30 meg. Ditto for VHF/UHF out of band gear.
When I started in comms as a boy, we lived in fear of the radio inspector (who I later found out was a nice bloke). 27meg changed all that.
We didn't end up with spectrum anarchy(much to my surprise).
Certainly there are problem emissions from time to time, and the odd HF private channel here and there. But on the whole, despite the availability of general coverage equipment to the public, there seem to be remarkably few problems.
A general coverage TX/RX option on the Codans would be nice to a point. The amateur option, for example, produces numerous squeaks and squarks as you tune around. The "tuning" is hardly convenient.
Codans were designed as channelized tranceivers. If we want other abilities then other gear is availiable.
What would a general coverage mod do for the average user ? Very little I suspect.
Could it be done? I think so. But the question I have to ask is "would it be worthwhile?"

Cheers
Jim

700. Re: tune TX

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-07-22 08:54:08 UTC
From: hz180
Topic: 684 Message: 700

Craig, I thought yours was an 8558 atu?
If its an 8558 then check done invehicle. Pull long side of case off and press tune. (with everything connected of course). Then check the 4 driver transistors on the AD board with finger. Be warned if one is hot it may be very hot ! If very hot, replace.
If its a 9350 follow directions on Bens page to service.

Cheers
Jim

It may be a stupid question and you probably have checked the basics, but have you checked the wiring? The connector on the back of my radio fell off (I hadn't put the screws back into the plug when I wired it up, so it slipped out a couple of months later - damn was I embarrassed when I worked it out), and I had the same problem you have described. It may not be so simple as a connector having fallen off - one of the wires may have broken, or similar. If you can hear the motor in the tuner going up and down, then it may not be this, however I don't claim to be an expert here - hope this may help you out.

Matt

Thanks Ben,
Still habven't gathered up the energy to go looking, but I must get the radio side checked before buying a new autotune.....however it won't tune even from cold. Funny thing is the autotune worked all the way across the desert however failed when I washed the dirt off at Yulara.....it stopped working that day.

It tries to tune but doesn't settle just fails....and I just had it going nicely too after doing the 8558 mod for my 80 Series.

702. 8558 tuning problems

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-07-23 06:38:15 UTC
From: Ben Hobson
Topic: 702 Message: 702

Craig
in my experience with 8558's (servicing a fleet with around 100 HF mobiles) the most common faults causing tune failure are;

1) coax or control cable broken/open circuit
2) BD 675 transistors on OPTION AD board in radio stuffed (hot to touch whilst attempting to tune)
3) Physical damage to antenna; animal strike, vibration
4) water ingress to antenna, mainly from cracked fibreglass, usually at the top

I would be checking 2 & 4 , as you mentioned it stopped working after you washed the mud off!

Occasionally the plastic tubing inside will shatter on early models.

There are no rubber sleeves inside an 8558 to break/slip and for that reason alone I tend to think they are a lot more robust , although slower, than the 9350 on rougher roads

see http://ozradio.wireless.org.au/58fix.htm for details on 8558 dissassembly & service.
They are reasonably easy to pull apart, just pay attention to the connector orientation

It may be worth a pull down anyway to lubricate the worm drive and check it all out, and check the earth plate is still making contact inside.

http://ozradio.wireless.org.au/9350fix.htm for the newer 9350 antennas

Ben

Thanks for the heads up Ben. I'll get into it on Thirsday or the weekend and see what gives. I was concerned that the control lead had maybe chaffed but I pulled as much of it out as possible and couldn't see any problems. I guess 2 is the easiest one to check.

Would it tune up once whilst cold or just not tune period....mine didn't tune at all.

From: apalsson
Topic: 705 Message: 705

Hi all,

I have been looking at prices for HFs and the best price I have found so far for an NGT is $3,775 while the Barrett 950 sells for $3,200

I have repeatedly e-mailed to Codan for pricing and dealer info around Sydney, they haven't bothered to respond.

While I apologize for Barrett questions in this forum, these are my questions:

Is there a reason for the price difference?
If there a features difference between the two?
What is likely best price for an NGT setup?

Any help would be greatly appreciated

Regards

Ari Palsson

Hi Ari, even though its a Codan group I don't think too many will be upset :)
The price differential is like most other "brand" stuff. They are priced at what the market will bear.
I guess that its also a matter of taste, some people like Barrett, some Codan.
Personally I like Codan. They have the runs on the board, and I find their older stuff very dependable and they work well.
I don't know the NGT unfortunately (though I wish I did :) but I have heard that the "easytalk" feature is very effective.
Anyone like to comment ?

Cheers
Jim

Hi Ari,

I to prefer codan and agree with Jim in it is a matter of taste. Comments I have heard about the Barrett are the amount of background noise and cracking of the autotune case other than that, choose your weapon.

I found the NGT easy to use once the book was read. During our trip to the Kimberleys last year and to Coburg Peninsular this year, there were constant comments from the VKS737 operators on the clarity of the reception, even compared to the 9323 in the car parked next to me.

Is $3775 complete with autotune? If so, it probably is a good price. I paid $3400 in November 2000 as a 4X4 show special and have only seen the same package at $3800 since that time. Downfall of the NGT is cost to have anything done to it ie: reprogramming of frequencies or the adding of options like the GPS interface.

Other than that you could pick up a secondhand 9323 with autotune for under $2400 through ebay or the trading post as my mate just did.

Regards,

Barry.

One big benefit of the NGT which may be the case with Ari is since most modern 4x4's have so little extra space for mounting stuff (everything being rounded moulded plastic) the NGT is just a handset and the base unit rather than mic, control head and base unit....this may be worth the $$ depending on your needs.

Craig

Ari,

There are a few companies in Sydney where you can actually buy a Codan, as there are where you can buy a Barrett. There is only ONE Codan dealer in NSW and that is McKays at Dubbo (this is the story I heard anyway). I chose a Codan over the Barrett simply because I felt (for my mind) the Codan was easier to use and the head was smaller (that was a 9323 model) + the fact I thought the tuner unit was more attractive and the connections were better, by having connectors on the tuner unit (on the Codan) rather than flying leads (on the Barrett). The word around the traps is Barrett is due to release a new radio very soon with a very small remote head and an even smaller antenna including tuner unit. I don't know if Barrett wants to release any details of that yet, but I have heard it from a reliable source. Why is the Barrett cheaper than the Codan? I can't answer that.

Brian.

ari,
i too have a 9323 and 9350 auto tune (both codan).
this choice was made for me a few yrs ago when i got this unit at the right price ($2500 new).
prior to having this hf, i had no previous experience with these 'toys'. in codans favour, i must say i found the codan 9323 very user friendly. it has served me fairly well for the last 2 yrs (though has been playing up lately). next radio upgrade will either be to a ngt, or a modern barrett. the reason i would like to try a barrett is to compare (i believe they (different brands) mostly all work..... :-)))
i guess i also lean toward barrett as i am from WA.
the remark about the ngt size is quite a good point too, nice and compact. i think with either a codan or barrett, you cant go too wrong.
regards,
paul lefevre

Thats a tough one to do long distance. Did it ever tx selcall? What happens when you try, does it tx at all or just nothing?
If it does TX, have you listened to it on another rx ? Checked the output on a frequency counter etc ?
Cheers
Jim

G'Day Ari,

I'd be cautious on ordering a Codan Radio if you cannot get anyone in Sydney to service it or repair it if it fails. Under warranty is one thing of course but Codan have a habit of discarding all of the older spares of H.F. Radios over several years old and not continuing to stock any parts at all for older models. This is quite true. I have heard many not so good stories of the "Auto Tune Antenna" dying due to our rough outback roads etc. Sorry, I'm not a fan of Codan for this very reason. I will say that they make a good H.F. Radio when the radio is operating. I own a Barrette 950 and I'm happy with the operation of it across this wide country of ours, i.e.; Perth to the Vic high country on VKS-737 no problems generally if atmosphere [no storms] is OK.

Regards
Terry

I have no trouble in getting spare parts for my Codan 8525 which has just had it's 16th birthday!!!!
These parts are not always available from the Codan factory, but they have appointed Service Centres which handle all the spares and technical info you require (within age limits).....
Try and go get a part for a 15 year old car from the Factory that made it !!

Maybe Terry doesn't know what is "quite true"

As for the antenna, I've tried them all and there is not a more robust antenna on the market than the Codan 9350.

I don't think I would be alone in these comments.

Whoppin.

Maybe after 7 years or so it may be hard to get some major parts, even having said that I brought a mounting bracket for a 8528 the other day from MacKays in Dubbo (Arrived overnight).
The thing is most equiment is not supported after 7 or so years, so regardless of the brand, it is only pot luck whether or not you can get the more specific bits ie Knobs, Faceplates etc.
On the other hand most failures are more common basic electronic parts ie Output Transistors etc.... These are more common are can be brought through many sources (I would go as far as saying , most repair shops don't buy from the original manufacturer anyway as the cost is much higher than an aftermarket supplier and the parts originate from different sources anyway ie Codan or Barett don't make their own Transistors or Caps , Resistors etc etc).
Having Said all that I have 2 Codan Setups 1 is a 9323 and 9350 the other a 8528 and 8558.
I have stuck with the Codans as they have never given any trouble at all, and a friend of mine who is a radio tech for the police said he has very few failures due to the equipment, mainly damage caused by going under low trees etc.
The other thing is I have never been able to get used to the Ugly...and I mean Ugly autotune that barett have come up with. They will sell many more setups if they get rid of that design as quick as posible.
I think both brands have there merits but I will stick with Codan, as I have had a trouble free run over the years and the shear number of Codans out there says a lot about their ruggedness.

Subject: [codan_outback_radio] Re: NGT Cost

Maybe after 7 years or so it may be hard to get some major parts, even having said that I brought a mounting bracket for a 8528 the other day from MacKays in Dubbo (Arrived overnight).
The thing is most equiment is not supported after 7 or so years, so regardless of the brand, it is only pot luck whether or not you can get the more specific bits ie Knobs, Faceplates etc.
On the other hand most failures are more common basic electronic parts ie Output Transistors etc.... These are more common are can be brought through many sources (I would go as far as saying , most repair shops don't buy from the original manufacturer anyway as the cost is much higher than an aftermarket supplier and the parts originate from different sources anyway ie Codan or Barett don't make their own Transistors or Caps , Resistors etc etc).
Having Said all that I have 2 Codan Setups 1 is a 9323 and 9350 the other a 8528 and 8558.
I have stuck with the Codans as they have never given any trouble at all, and a friend of mine who is a radio tech for the police said he has very few failures due to the equipment, mainly damage caused by going under low trees etc.
The other thing is I have never been able to get used to the Ugly...and I mean Ugly autotune that barett have come up with. They will sell many more setups if they get rid of that design as quick as posible.
I think both brands have there merits but I will stick with Codan, as I have had a trouble free run over the years and the shear number of Codans out there says a lot about their ruggedness.

Hello all,
Another newbie here, I have been registered for 6 months and have enjoyed the reading however I have had nothing to say. Now I have a question for you guys.
I just set up my 9323 to my old 8558 Autotune and am having trouble getting the tuner to scan. I had the exact same problem with my 8525 with 8551. When you turn the unit on it just sits there beeping and doesn't tune. I have checked all the cable connections with the oztripod webiste (bens) and have also checked that my autotuner works on a mates vehicle. Is there anything I am missing, is there a switch/jumper inside the 9323 to specify a tuner?

Many thanks
Aaron
97 Hilux with Codan 9323 (almost)

Folks,
I am a long-time lurker on this forum, and have never seen the need to add anything - there are a couple of resident "experts" who do a great job :-)
(A few of you know me personally, and there is the odd bit of amusing off-forum email exchanged.)
However, I take offence to some unknown bagging a product and a salesperson without any understanding or facts.
It sounds like the person works for an opposition dealer...
I have the odd professional qualification in the field, have sold/installed/commissioned/repaired Barrett and Codan, and have retained most of my contacts in the Australian HF industry since my (recent) retirement.
Here are some *objective* FACTS to add to the discussion.
a. The Barrett product is now quite old, and struggled to keep up with the 9323, let alone the NGT.
b. The Barrett can *never* have as good a receiver as the NGT unless Barrett finally starts to use good (read "cost lots more") filters and bases the radio around DSP. Codan do both.
c. The Codan radio is housed in an extrusion, unlike the pressed panels of the Barrett.
d. Codan have separated the RF *noisy* bits of the radio and placed them in a separate Junction Box which is physically removed from the RF Unit and the antenna.
e. The Codan autotune antenna is absolutely world-class, and I have personal experience of Barrett tuners falling apart in the field - they do not survive continuous driving on corrugations.
f. The number and ability of the engineers at Codan is extraordinary, and I believe that they have more R&D engineers than their competitor's complete staff level.
g. Codan is the undisputed market leader in the Government and Commercial fields, both here and everywhere where they are sold.
I know that both the SA and WA Police have just purchased some hundreds of NGTs, and you can bet your bottom dollar that they will have tested them against the Barrett.
Oh, we Eastern-Staters forget how parochial the Sandgropers can be, so they must have been pretty impressed by the NGT to prefer it over the local product.
h. I forgot to add that the DSP used on the Codan receiver eliminates almost all background noise, and anyone will notice an extraordinary difference between the Codan and Barrett, especially on weak signals.
i. I did not like it at first, but the handset on an NGT (when correctly programmed) makes the radio as easy to use as a mobile phone, so all you have in the cabin is something that looks like a mobile.

OK, there are some facts for you, and any Codan outlet would be able
to demonstrate them.
Put a Barrett next to an NGT, use them both, and you will buy the NGT.

My $0.04 worth :-)

Paul

Hi Aaron. Has the 9323 had 'scan" enabled on the channels you are
trying to use ? What does the display say when you try and scan ?
Anyone else got some ideas ?

Cheers
Jim

Hey Jim,
I prefer to lurk, and off-forum email suits.
I only look in here every few weeks, and guys like Ben and yourself
seem to be pretty good at fixing problems :-)
The only reason that I lifted my "Cone of Silence" was to remind
folks that this forum is meant to be here to help folks, and not to
throw slurs around.
I don't give a tuppeny damn if someone comes back and flames me, as I
won't look in here often enough to respond :-)
Anyone who takes offence at facts needs to go to some of the amateur
forums and see what REAL flaming is.....
I watched (with a large amount of glee, as I knew all of the parties
involved and had a fair involvement in near-field and far-field
measurement of these beasties) some wonderful punch-ups on Folded
Terminated Dipoles :-)
Me, I believe that only two adages need to be remembered:
a. Dip the plate and peak the load, and
b. If it loads, forget the VSWR :-)
Having said that, I do adore my 9350.

Later,

Paul

Seems like most lurkers are coming out of the cupboard. SO here is another one. I need to ask a question of the "Codan Gods"

What the $&%# is a 9528..... I have just been offered one to buy (actually looking for a 9323, but this is what came up)

Any ideas??

Stephen Mazza

Aaron
I'll have a wild stab in the dark here.
Does the 9323 have option AD fitted? This was required on earlier 8528's to drive the 8558 a/tune.
I have seen in a manual somewhere about removing option AD from the 9323 to run a 9350, so I'm guessing the 8558 will work on a 9323 with option AD. I've never actually seen the two together. Anyone else confirm?

Fact No1 I am not a hf expert
These are only oberservations on what happened whilst I have been travelling
Seisa campground 2xbarrett and 2xcodan both codans in our group made contact with VKS Adelaide barrett could not
Dulhunty River 2xbarrett and 1xcodan codan made contact with VKS St Marys Barretts could not
Simpson (2 weeks ago) I had to relay for a barrett owner to Adelaide base who was only camped about 1km from us
etc etc
Fact No 2 I am not a Codan dealer

ON MY TRAVELLS IT TOOK ME nearly 3 months before I saw 2 Barrett hf radios everyone has a codan. and up here in Kununurra About 90% have codan radios (Based on my observation of aerials) all NDC and other companys have codan..

When I was loooking to buy the barrett guys told me that fleet buyers buy barrett, wrong wrong

Around melbourne most people had Barrett cos they only used them once or twice a year, BUT one the road and in the outback all I see is CODAN CODAN CODAN

See ya

JaHFG,

I followed up on this advise with the codan tech support people. The guy there passed it onto the district sales guy to follow up on. Ho hum....expecting big sweep under the carpet, but to my surprise I received a phone call the next morning from a very apologetic national sales manager.

The result is Codan is sending the software, cables and instruction to the barrett agent and I will be getting my radio programmed for $60. Captive market syndrome has finally bitten our, what once was only, ripoff service agent and hopefully we will soon have a second authorised codan agent for him to compete with.

Regards,

Barry.

Yep even Jim (HZJ80) thought the Qld Police had Barrett's but all QPS HF's are Codan 9232's with some NGT's coming on line although the network will eventually be phased out by sat phone from what I can see. I have not seen any other Qld Govt vehicles with Barrett, all Codan.

Also a lot of long haul freight companies have Codan I have not seen a Barrett ATU on a truck or bus yet

ON MY TRAVELLS IT TOOK ME nearly 3 months before I saw 2 Barrett hf radios everyone has a codan. and up here in Kununurra About 90% have codan radios (Based on my observation of aerials) all NDC and other companys have codan..

When I was loooking to buy the barrett guys told me that fleet buyers buy barrett, wrong wrong

Around melbourne most people had Barrett cos they only used them once or twice a year, BUT one the road and in the outback all I see is CODAN CODAN CODAN

See ya

I could swear that it was a Barrett auto tune I saw in
Charleville.....they must of put something in the water :))Next time
I'll just go up and take a close look.....probably get run in for sus
behaviour.
Mind you there was no mistaking the new Codan 9350 I saw recently on
the back of a Police vehicle. It was a station wagon and the atu
mounting bracket was an interesting piece of engineering.
Wish they'd hurry up and go to satphones...I'd like a few NGT's :))))

Cheers
Jim

Can't see them getting rid of new NGT's in a hurry.

With the 8528's apparently they were crushed under supervision as they
were on a tradeback to Codan and they did not want them (probably not
wanting to flood the market) as there were some 100+

742. Barrett radio

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-03 04:21:02 UTC
From: bushy948
Topic: 742 Message: 742

I joined the group sometime back but i have just been happy to sit on the side and read. I brought a Barrett radio last November and dispite a few problems with it it is a good radio.
Now my question is that outside of basic knowledge of how a radio starts and stops I would like to find someone in the Newcastle NSW area that i could sit and work out some teething problems and who could guide me in the right direction.
Could they contact me off line.
Thanks
Bushy

Hello Craig and all,

Well the only NGT's in QPS are ones replacing written off ones or new
establishment ones. And this is only
because the 9323 is not available anymore (Main (99%) radio in fleet.)
In the area I'm in there is only one in
a Mt Isa vehicle.

Satellite system is only under test so far (QPS, QFRAand QAS.), only a
couple of mobiles will be trialled. It will be very expensive to
install, maintain and operate, a lot more than HF currently costs! It
will be a while before
Q Gov Emergency services go to satellite!

DPI (Department of Primary Industry) seem to be the only ones with a
large fleet of Barrett's her in NQ.

Regards,
Sam.

Aaron,
Ben has picked the possible problem, to run an 8558 a/tune on a 9323 you
DO need option AD!
Have worked on some here. Then when a replacement 9350 antenna arrived for
one fitted in a truck,
all that was done was to unplug the loom from the back panel to the AD PCB
and remove option AD
PCB and plug the loom from the back panel straight into the plug that option
AD PCB plugs into (As
per Codan application note 17-60034.). And replace the 8558control cable,
though adapter lead was
available if the 8558 cable was too hard to replace, i.e: Installed in body
of vehicle by coach builders.

There is normally a warning label on the back of the tranceiver stating
"Warning, Connect to 8558 Only"
if fitted with option AD, this is located above the antenna control port on
the rear of the tranceiver.
Codan option AD part number is:P/No 08-04285-001

Unfortuneately as my main computer is down I can't scan the manual addendum
and email it. If you need more
info email me, 9350 manual is next to back-up computer (Until the wife finds
it that is :-).)

Sam

Isn't 9328 the part number for the 9323 remote head?.
Gotta watch out for the number people quote, because it could be off
anything that's vaguely part of a complete install.

Sorry, if I'm way out of tune, here....

Ben,

It's not Aaron here, but I'll probably be the goose that has to install the AD board...since it currently resides with me. :-)

The black/white wires coming off the AD board are for data/clock signals, Are these located/sourced in roughly the same position with the 9323 as the 8525B?.

ta,

Gidday folks

Close Ian but no points. The remote head for a 9323 is a 9330.

Not sure if there is such a beast called a 9528. It sounds more like
an 8528 to me.

Ah well that's my two cents worth.

Cheers
CAM (hf_user)

Hi all,

lots of questions here, so I will say thanks in advance.:)

Does anyone out there have a manual for the Codan 8555 autotune antenna. I beleive this was the early auto antenna from codan (built by Moonraker in Tassie)prior to the well known 8558. I am in particular after the wiring diagram, (even colour coding on the wiring harness??)

I have heard around the traps that these ant's dont take to kindly to rugged outback roads, Does any one have any good experiences with these antenna's?

Where there many manufactured??

Also does anyone know if this antenna will interface with the AD option board? what is an AD board worth, are they easy to obtain these days, Has anyone ever made an AD board (artwork or notes available??)

kind regards

Paul

A question to the gurus. A friend has been sifting through his junk pile, and finding a couple of Codan 8222 and 8422 external selcall devices wonders if there is any use to them (well not for modern day radios anyway). Does anyone have any information or pinouts for these devices?

Matt

Paul
option AD information is available at
http://ozradio.wireless.org.au/codan.htm

follow the links to the antenna section....

Hi Paul, the AD boards should be relatively easy to obtain, even where you are. I was quoted about $50 each.
All autotune aerials have problems with outback travel. Stick me on a bullbar on the Canning/Gunbarrel and I'd have problems too !
If the gurus here can't help further, give me a bell and I'll pass along some other options for info.
Cheers
Jim

Hi Paul,
?
I have the small manual for the 8555, it includes schematics for the control box and the antenna, if you want send me your details and I will photocopy it for you. I heard some stories of the antennas failing due to the nickel iron/ferrite ? rod shattering and jamming in the coil. I am still using one and it works fine.

757. Base station aerials

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-09 06:20:22 UTC
From: hz180
Topic: 486 Message: 757

The "new" Bushcom BBA100 struggled into the air today, and I promised to post some preliminary results so here they are. Its about 10m high and almost flat, whereas the halfwave on 8.022Mhz has half vertical and the other half parallel to the ground but only 2m high. So I perhaps we're comparing apples and oranges but here are the results.

1) The Bushcom has an swr at least as good as its published figures from 3-30meg.

2) The difference between the aerials is very little on all signals, with the BBA100 having a slight edge.

3) The impedance of the BBA100 remains within acceptable limits for a 50 ohm line between 3-30 meg

4) It is a big aerial, well built and should stay up for a while.

5) Because of the vertical polorization of mobiles, I expected some 6-9db difference with the advantage to the dipole. I didnt find this was the case.

The above comaprison was made on 8.022Mhz

On 7050, there was little difference between a half wave dipole and the BBA100, both receive and transmit.

Preliminary conclusions indicate that the wider frequency range of the BBA100 far outweighs any disadvantages. We'll see.....

Cheers
Jim

Jim,

Thanks for the report.

My experience has always been that most broadbands (apart from the
B&W broadband load) have only been down a couple of dB around 7MHz,
and
only die big-time below 3.5MHz.

Of course, a couple of dB at 8022 is neither here nor there, so the
broadband antenna is an excellent compromise for the VKS-737/Bush
Telegraph frequencies.

Mind you, you get beautifully unpredictable lobe attenuation at the
higher frequencies, but those frequencies are not allocated to the
land mobile service.

Yes, you can expect up to 30dB cross-polarisation loss compared to
the 9350, but only for direct wave and ground wave.

Returning sky wave signals can be polarised any way, so cannot be
predicted.

I was involved in ionospheric modelling (with real-time measurements
using many ionosondes) some time back, and the results certainly bear
out the theory.

I used that to great effect by building a 5 element yagi for 10m FM.

It was cross-polarised, and switching polarity on a weak signal from
the States or Europe at the peak of the last cycle generally resulted
in a substantial improvement of the S/N ratio - of course it killed
the signal, if the antenna was already switched to the correct
polarisation!

Later,

Paul

Thanks for the reply. Apparently a couple of mates want to put selcall into their radios - I don't know what sort of radios they have, but assume that they are the older rock jobs without the built in selcall capability of the newer radios. Would appreciate if anyone has any info on the pinouts for these selcall units, and also confirmation that they are designed for the 72 series radios.

Matt

Hello Matt and group, I'm another lurker but it's probably time I helped out here. The Codan 8422 external selcall controllers were designed to work with the 6801, 6924, 7727 etc. and even the 85 series as long as they were fitted with option "PS". The pin configuration for option "PS" is ;
Pin 1 0 V
Pin 2 Rx FSK tones output
Pin 3 FSK Tx tones input
Pin 4 Quiet line
Pin 5 Alarm tones input
Pin 6 PTT
Pin 7 Scan
Pin 8 "A" rail
The connector used for option "PS" is the same as the one on the 8422 and I'm pretty sure the interconnect cable is wired one for one.
Rgd's,
Peter.

Hi Gary and welcome. Bushphone is a provider of telephone facilities
for land mobiles. Radtel are a similar service.

They are for people who can't stop putting their hand up to their
ear :)))

Cheers
Jim

Dale,

As Ben suggests, it appears that whoever programmed the set forgot to enable those options on the particular channels. You could take it back to them or re-program it yourself.

Go to Ben's website and look under the 8528 section and follow the instructions for adding Tx 'P' Channels. Tis also works for the 9323, except there are no P channels...you simply are able to program the whole EEPROM.

I can talk you through it if you wish...

Thankyou Ben you are right on the money. I found the info in my ref. manual for my 2000 model 9323 under display messages 10-6 .I was looking in the 94 ref. manal and could not find it,but after looking a lot harder it is there in appendices 6-14 channel programming options S- Self identification not enabled.This got me thinking was my 2000 model 9323 programmed correctly ????? as I had it programmed at the same place by the same person 2.5 years ago.Unfortunatley I was right NO sellcall or beacon call available on the RFDS freq. everything else ok. I know I could contact RFDS via VKS or Penta but I thought the RFDS was just a sellcall away. My point is that because I dont talk to RFDS on a regular basis (ie never and hope it stays that way) is all users should check for correct operations on freq not used very often but relied upon

Hi Miro. I've seen a few attached to cargo barriers without problems.
I attach mine to the rear side behind the barrierand just below the
window. Screws up tight, and no long earthing problems.
Cheers
Jim

Miro,

I have attached mine to the cargo barrier. I did this simply because I wanted the transceiver at a reasonable height off the floor so if I flooded the car I wouldn't also flood the radio (unless I really drown the car). There really wasn't anywhere else to put it apart from on the cage either. I have the remote head in a roof console. In my last car I built a roof console at the rear of the vehicle to house all of my radio equipment, but this wasn't practical in the new car. Also this was the only place I found it would fit anyway as it wouldn't go under any of the seats.

Subject: [codan_outback_radio] Setups

Hi All
Im only new to the HF game and I just purchased a Codan 8525 with remote head. What would be the best spot for attaching the transceiver. Someone told me to attach it to the cargo barrier, is this is a good spot?

I will put the head in a roof console.

Dale
the RFDS do not use Selcall. They use a tone calling system unique to themselves. You program RFDS channels in your Codan as E calls (RFDS emergency calls) This applies to all codans since Noah was a boy.
You simply press and hold the Emergency Call button (On 8525/28 anyway) to contact them. Other organisations such as VKS737 have an arrangement through their telephone interconnect whereby a selcall to a certain address will redirect you to the RFDS via phone. This saves you the need to purchase a seperate RFDS outpost licence.

Ben

I find the cargo barrier between the barrier and the rear seat is a good compromise if you dont plan on going for a big swim. That way objects in the back dont hammer the transceiver
Personally I dont like overhead consoles, but anywhere convenient and easy to run cables to will do.

Good point Ben about loose cargo flying in the back I found that mounting between the seat and the cargo barrier was also out for me as there was no room there either. I ended up mounting in the cargo bay section (on the cargo barrier) and in front of where the fridge goes. The fridge is tied down so it doesn't move anywhere. The amount of room between the fridge and the radio is sufficient to supply a good airflow but too narrow to fit anything else in, therefore it is well protected.

Brian.

Thanks for all the help. I was thinking that crap in the back could cause probs...and it cant go between seat and cargo barrier,nor under the seat (just dont like the idea with that, i have found some weird stuff under my seat) anyway behind the fridge sounds good to me.... just go to get the fridge now... he he :-)

Thanks again... will let you know how I went and Im sure ill be on soon to ask plenty more questions about the more technical side of the thing.

Cheers
Miro

So where would the best spot for the head be?

I don't like the idea of my radio being in front of the cargo barrier..in the event of an accident I dont want it flying through the air.
I put my radio head on the side of the gearbox tunnel where I can just glance and operate easily with my left hand. Of course being an old B I have to get my glasses out to read it !
Have been known to stay on one channel when driving for that reason alone.

Cheers
jim

783. Purchasing a new(ish) NGT

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-12 18:48:58 UTC
From: apalsson
Topic: 783 Message: 783

Hi all,

Thank you all who responded to my questions earlier about Barretts vs NGT, Antenna locations, etc etc. I am grateful for the patience and the informative responses.

Armed with the information I have from this group, I have found a 4 month old Codan NGT which is due to be installed in my GU Patrol on Friday. The price is similar to a new Barrett, so I figured that this was good value.

The installer has suggested that he install the autotune antenna on my bullbar, as he claims that I will get better propagation that way. Despite of my problems with having this big antenna in front of me, I am going to take his advice and run it there for 4 - 5 weeks to see how well I get used to it. If I can't, I will move it to the spare wheel mount.
I have found a company in Adelaide that makes neat looking brackets to fit between spare wheel and door.

Now the questions: Which clubs / organizations should I join for channels?
VKS737 seems an obvious one. I am also keen to get access to making calls to the telephone network and also, some emergency services, should I run into trouble.
What do you guys recommend here?

Regards

Ari Palsson
GU Patrol - soon to get a Codan NGT

With a GXL 80 series at the front edge of the centre console over the coin pocket thingy is a pretty good spot for my 8528 head unit. The big pocket underneath is still useable, the headunit is out of direct sun and also can pivot up to read etc, plus is readable at a glance on the move.

Personally I am on scan when on the go so and am only interested in selcall's. I know some like Jim are listening for interest more than I am....Jim take your wife she can talk to you :-))

Also my base is mounted on my rear draw set which means it comes out when the draws come out....not ideal but I prefer not to have the Codan ATU mounted around town anyway....so no radio is not an issue.

Craig

without re-opening the great debate, the antenna WILL perform better on the bullbar, however mounting it there may not comply with your local traffic rules. Check these first.
If the installer can mount the antenna behind the bullbar all should be fine.
VKS would be a good one to start with, they can connect you to RFDS and Police etc on your behalf if needed.
The NGT is a great radio once you learn how to drive it. Have fun with it!

You never saw the photo's of the one I had on my old Patrol (Circa
1985.). Mine developed the banana Syndrome
(Bent like a banana.) even after all the testing I did for Codan with
new type whip tops (The original was a fold
front and back only pivot mount hollow aluminium tube whip (Not
flexible!.), the second type was a whip on an adapter with a spring,
like a small trampoline spring which stretches when pulled, inside a
stainless tube to
another adapter mounted to the top of the main antenna with a pin
through the original tilt over slot.) Then there
was the 6" bright red neoprene rubber spring that went between the
antenna mounting stud and bullbar to cut
road vibration and add flexability for the antenna to move as a whole
unit with vehicle ride movement.
There was also 3 firmware upgrades to the antenna controller box.
Mind you apart from the physical problems
the antenna worked flawlessly once all the mods had been done. Working
relay whilst mobile for RFDS Broken Hill to their plane and to the
property awaiting the plane for an urgent medevac proved that the
antenna would
hold it's tune! The antenna ended its life after a mitsubishi colt went

through a stop sign at 80 k's int the front
drivers side of the Patrol. When last seen, the whip-top was rapidly
gaining altitude heading for New
Zealand, it was never seen again. The red neoprene spring ended up on
the wifes Suzuki LJ80 for the 27 mhz CB.

Final Thoughts.: Don't get a Marine antenna manufacturer to make a Land
Mobile antenna

>

My wife spent 20 years talking to me when traveling in the bush. She
rekkons she never got the first lot of red dirt out of her hair.
Strangely enough I usually scan but only turn the volume up to listen
occasionally. I find that when I go solo it takes quite a bit more
concentration.
Besides, when you talk for a living, a bit of peace and quiet is good
stuff :))

Ben,

Well put.

Also remember that ACA allow you to use any frequency (whether you
are licensed or not) in an emergency.

Paul, I wonder if there's ever been a situation that required that
regulation to be tested? I suspect that if there has been then it
would be quietly forgotten by the authorities. One thing's for sure,
it had better be life threatening. Running out of beer does not
qualify one to yell "help!" on a borrowed radio :)
At the risk of appearing pedantic, if I remember correctly the ACA
are bound by international convention with this particular
regulation. I seem to remember it dating from the "Safety of Life at
Sea" regulations of my Radio Ops days, a very long time ago.(Yes,
Fred Flintstone and Marconi were mates of mine :)))

Jim,
Food for thought, thank you.
Mind you, if I needed to make a Mayday call I would put it out on any channel available to me, and worry about the consequences later.
I reckon that it's easier to ask for forgiveness than to ask for permission :-)
Oh, any plonker that told me that I could not communicate with them because I was not licensed on their network, even in an emergency, would get a fistfull when I finally caught up with them.
Many years of using HF have led me to the inescapable conclusion that lots of folks have no lives at all away from the microphone, and that they derive the greatest joy from trying to impose rules on others.
No, Fred Flintstone and Marconi have never visited my shack, or they would try to nick my 6AU6 and 6L6 bottles that I keep for a rainy day :-)

Paul

Paul I couldn't agree more. I've been the object of desire for a few
rule makers. Unfortunately for them I've had the runs on the board to
make em pull their heads in.
On a different note, I once listened to a RFDS doctor handling an
emergency. He did a great job reassuring the parents of a child that
had fallen seriously ill a long way from nowhere. I'm sure that
others would have similar stories to tell about various organisations
and situations.
When the ^&*(hits the fan, the rule makers are quite irrelevant. In
an emergency I'll render any responsible assistance that I can, and
would encourage others to do the same. Irrespective of license or
network membership.
Please note I said "in an emergency". I am not suggesting that the
normal rules and regulations aren't there for a reason.

Jim
PS I think even Marconi was partial to the odd 813 or two :))

A techo I know ended up being a bit intermittent. I rekkon it was the
audio rectification on the grid of his waveguide that did it. He was
never the same, poor fellow. He would wander around
mumbling "umm...I=E overMC *2"...and always whinging that he couldn't
find a nice female connector.
I've been told that faults with the Codan connectors can have the
same effect ! That micro board can lead to some major headspins :)))

Jim

Comprehending Engineers-Take One
****
Two engineering students were walking across campus when one said, "Where did you get such a great bike?" The second engineer replied, "Well, I was walking along yesterday minding my own business when a beautiful woman rode up on this bike. She threw the bike to the ground, took off all her clothes and said, "Take what you want." The second engineer nodded approvingly,
"Good choice; the clothes probably wouldn't have fit."

Comprehending Engineers-Take Two
****
An architect, an artist and an engineer were discussing whether it was better to spend time with the wife or a mistress. The architect said he enjoyed time with his wife, building a solid foundation for an enduring relationship. The artist said he enjoyed time with his mistress, because of the passion and mystery he found there. The engineer said, "I like both."
"Both?" Engineer: "Yeah, if you have a wife and a mistress, they will each assume you are spending time with the other woman, and you can go to the plant and get some work done."

Comprehending Engineers-Take Three
****
What is the difference between Mechanical Engineers and Civil Engineers?
Mechanical Engineers build weapons, Civil Engineers build targets.

Comprehending Engineers-Take Four
****
The graduate with a Science degree asks, "Why does it work?" The graduate with an Engineering degree asks, "How does it work?" The graduate with an Accounting degree asks, "How much will it cost?" The graduate with an Arts degree asks, "Do you want fries with that?"

Comprehending Engineers-Take Five
****
To the optimist, the glass is half full. To the pessimist, the glass is half empty. To the engineer, the glass is twice as big as it needs to be.

797. New NGT Installed (beginners questions)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-16 19:54:08 UTC
From: apalsson
Topic: 797 Message: 797

Hi all,

Yesterday, I had my new Codan NGT installed and I have been playing
somewhat. The fibreglass whip for the autotune was missing but until
I receive it, they installed the steel whip for me.
I was given some training on how to use the radio and have found it
relatively easy to pick up the basics.

I have a couple of questions for the wise panel: :))
Do I expect a big performance impact from the stainless steel whip
over using the fibreglass one?
If I join a new club or a network that has additional frequencies,
what do I have to do in order to have these added?

Regards

Ari Palsson

Hi all,

I was wondering if we could make use of the database facilities on this list and create a Contact Database, where members would enter in their Name, Location, Vehicle Type, Radio Type, Selcall, Clubs etc.
It could be handy if these particulars were available to listers to be able to contact each other.
Moderator, what are your thoughts on this?

Hi Ari. I don't know the NGT well (although I'd like to :) but I'll
attempt to answer your questions.
Firstly, the fibreglass whip will enable you to use some fairly low
frequencies. The fibreglass one should go on 2020 for example whilst
the steel one may not. There isn't an awful difference in the
performance other than frequency range.
Unless the NGT allows user programming (and this has never been a
feature of Codan equipment) any alteration in frequencies will
usually be done by the dealer who will charge (some say like a
wounded bull).
Congratulations on the NGT. The mail seems to be that they are a fine
radio.

Cheers
Jim

Ari, I'm not the moderator but you can do this through Yahoo by clicking on a members name or email addy in the members page (I can't remember which). When I first joined the list a while ago I thought it was strange that there wasn't any reference to what people's interests were, or what they did for a living.
I now know why. Some of the members are involved in all sorts of aspects of communications whist others are not involved in the technical side at all. All have something to contribute and there is a wealth of experience and knowledge on this list. Few, however, have the time to contribute as often as they'd like to.
If you check the archives you'll find that most contribute as often as they can. It's a pretty good list with some great people on it.

Cheers
Jim

Ari,
I agree with Jim
the only difference being the steel whip wont tune below about 2.5 mhz
as far as adding new freqs to the ngt, they can be programmed by a codan
dealer via the small socket on the handpiece. at least the radio doesnt
need to be removed from the car

I dont know what your dealer's policy is, but I would have ensured
pretty much everything was in the radio from the start, vks, radtel,
bushphone, rfds, cb and the usual abc receives etc
that way you dont need to have it reprogrammed all the time.
As for price well you get what you pay for, there is an awful lot of
design gone into the radio and they have to cover costs somehow. Upwards
of $80 to reprogram ANY radio is not unusual these days, Look at what it
costs to have a mechanic change the oil in your car.

I do beleive you can add receive only freqs from the handpiece. I will
read the book when I get a chance.
Just installed a NGT in the work car. havent had much time to play, but
I did notice the received audio is crystal clear, if not somewhat
digital sounding. Codan have done a marvelous job on the Digital Signal
Processing.

Ari,
great idea but I think if members wish to be contacted over the air it
would be easier just to sign off with their name, selcall and network if
they wish.
Most memebers only check their email & rarely visit the groups website

Ben (does anyone know what the moderator is up to these days???)

Hi Ben,

Thanks for the explanations.

<big snip>

> Just installed a NGT in the work car. havent had much time to
play, but
> I did notice the received audio is crystal clear, if not somewhat
> digital sounding. Codan have done a marvelous job on the Digital
Signal
> Processing.

Having had the unit for 2 days only, I obviously don't know what to
expect in terms of voice clarity.
In the few calls I have made/received though, I have felt that the
voice is somewhat "hollow" like if there is a very narrow bandwidth
on the audio channel.
In my early radio repair days (20-odd years ago:), I would have said
that it was somewhat undermodulated or audio filters were set very
tight.
I take it this is very dependent on conditions though, as well as
channel (frequency) and other things.
The radio has a setting called "clarifier", which I would imagine
has direct effect on the signal processor???

All the best

Ari Palsson

804. Set Up Done now what?

Topic: 804 Message: 804

Ok I got the unit into my Car. Its an 8528 with a 21 tap aerial. I turned it on and it works (yeeha).... is there a way to check that tx is working, without breaking some sort of protocol. I have signed up with VKS (so I should have a call sign and sell call soon), possibly with too much haste as I only just realised that are other organisatons out there. I have never really used a HF radio... apart from a 527 set, which doesnt really count....well at least I know who that ROGER guy is.

Anyway the set that I purchased came from someone who had it set up for VKS and was using (I think) the 8022khz range. How do I check this?

The set is receiving as I was able to hear Timor radio... well I think it sounded timories. It scanned through a strange series of numbers and than I gave up cause it was getting too cold outside.

If I was to use it in Sydney... do I have to change anything?

Thanks in advance for you help.... and Im sure Ill plenty of other questions soon.

Call them and ask if they will allocate it over the phone, usually no
worries.
Apart from that, yes there are ways to check its functioning but they
usually aren't not for the beginner (unless you want to put it near a
TV :))

> possibly with too much haste as I only just realised that are other

Horses for courses. They are all very good but 737 do have the
membership so there's always someone around.

>I have never really used a HF radio...

Don't worry, they are very tolerant of beginners, and you'll soon be
using it like a pro.Make sure the aerial is on the correct tap before
you transmit or you could damage the set over a period of time.

apart
> from a 527 set, which doesnt really count....well at least I know

8022 is the main 737 freq and is designated chan 2 by 737.

The 8528 identifies transmit and receive frequencies on the control
head. (The bit the microphone plugs into).

The aerial is a little different. Commercial whips should be no
hassles, if in doubt post here again.

Sorry, forgot a question. The only thing you'll have to change when
using it in Sydney is possibly your driving habits. You may get
abused when the other drivers see your smile as you listen to mobiles
on the Canning stock route, Broome, the Kimberly etc :)))

Jim, if the VSWR is bad (wrong tap etc) the codan will drop the TX power
to avoid damaging itself

try this by watching the TX light as you talk. It will be bright if you
are talking loud & the antenna is tuned. ever notice on an autotune it
is dull and then suddenly goes bright as it tunes

Yep, appreciate that Ben. I guess it depends on how well the ALC circuit is working. Was told by someone who used to repair em for a lot of non technical users, that this was one of their major problems. Users transmitting into the wrong tap over extended periods. Anyway who am I to argue. I put the chan numbers on mine in white, so my customers at least have a chance to get it right :)))

Jim, if the VSWR is bad (wrong tap etc) the codan will drop the TX power
to avoid damaging itself

try this by watching the TX light as you talk. It will be bright if you
are talking loud & the antenna is tuned. ever notice on an autotune it
is dull and then suddenly goes bright as it tunes

If the taps are labelled with frequency it will be obvious. If they are
labelled 1 to 20 then try and contact the manufacturer and see what tap
corresponds to which frequency.
All else fails, select a frequency, un mute the set, turn up the volume
so you can hear it at the front of the car and change taps until you get
the loudest white noise .[ex RFDS tech taught me that one!]

Hello Again

Well I have had a look at the aerial and its a Lencom one. It has a 1500 WL Marking near the base and then numbers going up from 1-21.

I guess I might need to ring the company.

Another question that I have, can I have the HF aerial and UHF next to each (aprox 20cm), will this cause some sort of interferance?

and

What does the scan actually do.... as when I scanned I only heard what sounded like commercial radio. Should I have picked up some radio chatter at all?

Cheers
Mirek

Hi. The Lencom aerials were made in SA , and there are quite a few dealers over this side of the beach. (I think). The numbers in this case don't mean anything to me, but if it's older than a few months, some of the taps may be outdated. (There was a big shake up in the provision of radio telephone services recently).
I would take Bens suggestion and try for the tap with the most noise on say 8022. That should give you 737 Chan2 at least.
The UHF aerial should be ok there but separation of the two wouldn't hurt either.
Scan is the facility to automatically monitor frequencies in sequence. It can be set up via the user to cover whatever chan you like. For example mine is set up to scan 737 frequencies and a few amateur ones also. This is detailed in the user handbook.
Go to Bens radio site, http://ozradio.wireless.org.au/ and you will find he's done a wonderful job of providing a wealth of information on Codan radios.
Cheers
Jim

Well I used all the knowhow I have (not much I must add) and the information you had all given me and I got my radio to work. What a great bit of kit.

I spoke to VKS last night and it was loud and clear. My CS is R3836 and sell call 3836.

Hope to hear someone on net oneday.

Oh another question... with the tap aerial do I have to change the taps everytime I use different freqs?

Cheers
Mirek

Congratulations. Yes, the radio should be an essential part of every 4wd that ventures off the beaten track. Sounds like you're heading the right way with that one.
Yes when you change chan you have to change the aerial taps. 737 go down to 5455 after 8022, so it should be easy to change taps while listening. That will give you 2 tap positions :)))

Cheers
Jim

820. Buying second hand

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-22 06:53:10 UTC
From: bwyhoon
Topic: 820 Message: 820

Does anyone have advice for me when buying a second hand HF?
Is the 8525B a good unit and can it be easily programmed for all modern frequencies?
Thanks
B

821. Re: [codan_outback_radio] Buying second hand

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-22 07:32:21 UTC
From: Ben Hobson
Topic: 820 Message: 821

The 8525B can easily be re programmed
They are a 99 channel unit that will transmit from 2 to 24mhz, receive 0 to 30mhz.
its predecessor the 8525A is also 99 channels transmit 0 to 18mhz, receive 0 to 30mhz

The 8525B can be upgraded easily to the newer 8528 which will give it 601 channels, direct dial radphone, amateur and a few other capabilities

be mindful some of the early 8525B will not work with a 8558 autotune without an extra (hard to find) 8551 interface box. They will however work with the current 9350 antenna

For more info visit
http://ozradio.wireless.org.au/codan.htm

822. Codan 8528 flattening batteries

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-22 08:30:38 UTC
From: andrew lukies
Topic: 820 Message: 822

Hi everyone
I think i have a Codan 8528 that is flattening
batteries.
Yesterday, i was faced with a flat battery in the
Cruiser after 2 days of not being started.
After getting the motor going, i started checking for
the source of the drain. Nothing seemed to be left on
in the car, so i started removing auxilaries off the
battery with the multimeter in position.
When i came to the Codan, there was a clicking sound
from within the main box as i disconnected it, and the
battery *(which was loosing 0.01v every 5 seconds or
so)started to recover.(the radio was switched off)
I swapped an eprom not that long ago, and was
wondering if this could cause my symptoms?

Andrew
Even when turned on in receive mode the '28 will only draw about 400mA
Only way to tell for sure would be an inline ammeter with your battery
and start disconnecting things one by one
I doubt the codan by itself would be enough to flatten a good battery in
two days, maybe your battery is on its last legs?

Andrew,
How long will the battery hold up with the engine stopped and the lights turned on?
sometimes you can have a faulty cell in the battery.
A dead give away is the battery won't crank the engine for long periods without flattening.
Most battery Shops can do a "Load" test that will tell if the battery is at fault.
I had one last week that did the same thing.....

John

I made my eprom eraser from the spare UV tube at Jaycar $28 and a 6V flouro torch from Kangaroo tent city.
All I need to do is fit it into a box with a 6V plugpack and door switch to turn it off when I open the box, so far a shoe box has sufficed, any way $39 in all if you can scrounge a suitable box from you junk pile.
takes about 15 mins to erase

830. UHF Instal

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-24 23:44:40 UTC
From: David Graham
Topic: 830 Message: 830

Hi all,

A quick question, not Codan related, but still the same genre; I am about to install a UHF radio in my wife's car. Do I leave the aerial coax full length or is it best to route and cut it as short as possible. The instructions say not to tune the antenna as it is pre-tuned and should not require adjustment, but how could it be pre-tuned when you buy the antenna separately and there are so many types?

Thanks again for your advice. It is absolutely great to get straight-down-the-line info from people that know. Unlike radio shops that seem to put a spin on things to clinch a sale.

Much appreciated,

David Graham

Topic: 830 Message: 831

Hi David, I'm sure the UHF experts will jump on me here but I'll try and help. Firstly I'd leave the coax as it is. Cutting and putting new plugs etc on will only increase the chance of introducing problems down the track. You're probably not going to get a lot of loss with the extra cable unless its very long.
The term pretuned usually means that it will operate within acceptable limits over that frequency range. Aerials are tuned to the impedance of their feedlines, not to the radio. If they are installed as per instructions there shouldnt be any drama.
Cheers
Jim

Topic: 830 Message: 832

Hi David, to the purist, trim all excess feedline because the usual coax used for mobile installation (RG58 or similar) is particularly lossy on UHF CB. In reality, unless the excess cable is more than a foot or so, don't bother to trim it as it leaves a little bit to play with in case you need to resolder plugs or similar.
Antennas on UHF are a lot less "touchy" than they are on HF - in saying this I mean that an antenna tuned for UHF CB will have a good "tune" for several MHz either side of the CB band. Unless you install the antenna in a stupid spot (i.e. at the base of your bullbar), you should be fine - having said that, you should always check the SWR of an antenna when you put one in. I always install the antenna in a clear spot on cars, and try to keep a reasonable distance between antennas (i.e. not right next to each other) - it is a bit hard woth my current setup as I have 4 on the bullbar as it is, and whilst there is some interaction between them, they all work well (HF, 27MHz CB, UHF CB, and a dual band amateur one).

Subject: [codan_outback_radio] UHF Instal

Hi all,

A quick question, not Codan related, but still the same genre; I am about to install a UHF radio in my wife's car. Do I leave the aerial coax full length or is it best to route and cut it as short as possible. The instructions say not to tune the antenna as it is pre-tuned and should not require adjustment, but how could it be pre-tuned when you buy the antenna separately and there are so many types?

Thanks again for your advice. It is absolutely great to get straight-down-the-line info from people that know. Unlike radio shops that seem to put a spin on things to clinch a sale.

Much appreciated,

David Graham

Mirek
the older 8558 are hard to find and require the option AD board fitted
to work. Make sure you have this board or purchase it with the antenna.
The new current 9350 antenna do not need this board and are around $1400
new.

http://ozradio.wireless.org.au/antenna.htm

for info & pictures of autotune antennas

cheers

Well I guess for that price I will have to put up with the aerial
that I have. Just have to get out of the car to change the taps.

Ill see if I can find a 2nd hand one :-)

Cheers

Second hand 8558's are usually around 3-400 and as Ben says, you'll need an Ad board or 8551. Personally I suspect that there's still a lot of life left in the 8558 series of autotunes. Unfortunately Codan dont seem to agree (wonder why ?) and bits for them are often hard to find. In fact I have one waiting on bits at the moment. Small but important bits :-)

Cheers

838. Codan 8528 - 8558

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-27 09:46:46 UTC
From: Matt
Topic: 838 Message: 838

Evening to all the gurus out there. I am currently experiencing problems with my HF setup in the car. When go to tune the antenna, it almost straight away comes up with the message "Tune Fail" - it doesn't seem to try to tune the antenna (like when there is no lead to the antenna plugged in - which I have done before). Is this a software fault, or does it indicate a fault with the AD board/antenna? Problem occurred after I had changed freqs, and went to retune (whilst parked) - any ideas??

Matt

Matt,
It is most likely one of two things.
1) No TX power
disconnect the antenna control cable, leave the coax connected
hold in the tune button for a few seconds, is the TX light BRIGHT?
If not you have either killed the PA or blown the PA fuse.look inside
the PA section near where the DC supply comes in. should be a small fine
wire fuse soldered between two pins. there may be a few of them. look
for the one with the air gap. I usually replace them with a fine strand
of speaker cable or similar

2)stuck worm drive in the antenna

Is the antenna making noises (stepper motor moving)
If not, a bit of gentle persausion may be needed, they get stuck
sometimes (percussive maintenance)

If it tunes after a few moderate thumps, I suggest its time to pull the
antenna apart for some maintenance/lubrication

If the radio sits there & beeps and the antenna is making noises, open
up the radio and feel the four BD675 transistors on the option AD board.
If they get hot during tuning attempt, you have found the problem.

Ben

Have had a couple of adapters made for the top of the 9350, so I can use cheaper whips, smaller springs etc. Have posted a couple of photos in my folder for those interested. Cost $15...made from brass and chromed...seem to work OK. 1/2 inch WW to 5/16 I think are the specs. Initially I thought I might be able to plug the old CB antenna on top, but when I checked out the power handling capacity of the whip it was 50 watts...better not!

Cheers,

Hello
I have an 8528 which I currently use with a whip aerial. It has a connection on the main box of tricks with "antenna control" written above it. I assume this is for connecting an auto tune antennae. How do I determine if this would be suitable for a 8558 type or a 9350 aerial? i.e. do I have a AD board or not??
Regards
Greg

Hi Greg. Yep, thats for the cable to an autotune. No ad board necessary for a 9350, just plug and play. To determine if you have an AD board, take the longer of the two covers off and place with the front towards you. Look at the left side back and if you have the ad board you'll see it connecting to the cable that goes to the ant control connection. The board itself has a heatsink on a device that is bolted to the side of the chassis.
Hope this helps.
Cheers
jim

Not sure about making them work with a non Codan radio. Doesn't sound too feasible to me. Good luck with that one. The connectors/cables for the 8558's seem to be a bit scarce / expensive. Would be nice if anyone had a source of them at a reasonable price for the group.
Cheers

a great idea. I had some made up for work vehicles at around $5 each unchromed.
If you apply the same idea to a 8558, you may notice after a while that a standard stainless steel tapered whip will break off near the base.
Source a whip that has a spring inbuilt to the base (like the early Codan ones) and it solves the problem. The whips dont seem break on the 9350's.
I think it must be a vibration set up with the 8558.

854. whip adaptors

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-28 09:42:59 UTC
From: Ben Hobson
Topic: 854 Message: 854

Jim
I did hear this and know of people who have had them break, I was referrering to the 7/16 whip with inbuilt spring, made by POLAR (????????)
However, I have 2 vehicles at work running 9350 with the codan spring whip for 200,000km + each that havent broken yet (and they aren't tar babies either!)
The straight codan whips are fine on the 9350, but my experience is the codan and other 7/16 tapered whips break on 8558's I have no idea why, but am guessing at some resonant frequency is enough to fatigue the whip where it enters the base.

ben

Codan told me that the steel whip with the inbuilt spring had a weakness where the spring was, and that was the reason the later whips were straight.
Of course I believed them as a friend had his whip break several times at the spring bit.

857. 8528 remote heads

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-29 00:04:48 UTC
From: explorerozi
Topic: 857 Message: 857

Hello again - next Q

Are the remote heads on 8528's universally interchangeable - i.e. is it possible to swap them without causing any problems? I am aware that the 8528 evolved somewhat during its production period and therefore was wondering if this may make some remote heads incompatible with some units??

Also is any information/data stored in the head or is it all held in the main unit?

Your advise is much appreciated.

Regards
Greg

858. Re: [codan_outback_radio] 8528 remote heads

Topic: 857 Message: 858

Greg
ALL 8528 remote control heads are interchangeable, including the grey radphone head numbered 8533 and the larger head with the inbuilt speaker. 8528S (marine) heads are also the same, apart from the buttons being labelled differently

The selcall ID, channel info, scan groups etc are all kept in the transceiver

and For your info, the remote control cable is the same for 8525A, 8525B & 8528

cheers
Ben

859. re 8528 flattening batteries

Yahoo group: codan_outback_radio (1997 — 2004)

From: andrew lukies
Topic: 818 Message: 859

Hi everyone
I may have found the problem with my battery
flattening over two days.
I found the plug to the remote head had been knocked
off the main unit. (I reinstalled everything after a
new eprom and didnt do the securing pins up)
Would this cause the unit to use XS power??

Andrew,
I wouldnt think so, even if the transceiver was in the ON state with the head unplugged
it would still only draw a few hundred milliamps. hardly enough to flatten a battery in a day or two.
Did you try an ammeter in series with the battery to see what the current draw is ??

Ben

Andrew my 8528 has been permanently hooked up to my main battery for about 3 years with no ill effects. However I do have a 25A on an old battery in the workshop, and it needs recharging every couple of days even if the 25 isn't switched on. Get a meter on it as Ben suggested and if not drawing excessive current check the battery.

864. 8528 + 8558

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-31 03:59:05 UTC
From: explorerozi
Topic: 864 Message: 864

Hello again
Ok - I have the above combination set up ready for action - one problem when I press tune on any channel I get "tune fail" after all the beebs. I have checked the resistors on the AD board as mentioned on Bens web page - they seem to be pretty cool so no problem there. What other troubleshooting can I carry out before heading to the radio shop?

Also can you plug in a whip antenna and use this - the unit has a warning on the back saying only use 8558 - I am assuming this means dont use any other trype of auto tune.

Thanks

Cheers Greg

Its advisable to go through the message archives if you're stuck. I've posted Bens answer to a similar problem which will give you something to go on.

It is most likely one of two things.
1) No TX power
disconnect the antenna control cable, leave the coax connected
hold in the tune button for a few seconds, is the TX light BRIGHT?
If not you have either killed the PA or blown the PA fuse.look inside
the PA section near where the DC supply comes in. should be a small fine
wire fuse soldered between two pins. there may be a few of them. look
for the one with the air gap. I usually replace them with a fine strand
of speaker cable or similar

2)stuck worm drive in the antenna

Is the antenna making noises (stepper motor moving)
If not, a bit of gentle persausion may be needed, they get stuck
sometimes (percussive maintenance)

If it tunes after a few moderate thumps, I suggest its time to pull the
antenna apart for some maintenance/lubrication

If the radio sits there & beeps and the antenna is making noises, open
up the radio and feel the four BD675 transistors on the option AD board.
If they get hot during tuning attempt, you have found the problem.

Cheers
Jim

Thanks Jim - should look though the archives shouldn't I!! Anyway plenty of Tx power by the looks. Resistors seem OK. Aerial makes only a bit of noise for about 1 second during the 15-20seconds of Beeps. Suspect I may have to have a look inside. Regarding my other Q - can I attach a whip antenna in lieu of auto tune??
Thanks
Greg

Hi Greg, didnt mean to sound upperty, just trying to help :))
Yes you can attach a whip. Now I'm not sure here, someone will jump in and correct me if I'm wrong thats for sure ! (I don't mind because I learn stuff too). Personally I would remove the ad board before using the whip. Not sure if you have to. It only takes 3-4 mts. Make sure the whip base is grounded well.
Cheers

Greg, that's great. Those wonderful colored bits are dreamt of by more than a few technicians from time to time :))
Pleased to see that you're up and running. Good luck with the 8558. There is one other suspect and that is the cable between the set and the autotune. But dont worry about it until you've overhauled the atu. If its making noises and wont tune, its *bound* to be the aerial. (famous last words ?)
Cheers

871. warranty issues

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-08-31 23:26:52 UTC
From: P & B LeFevre
Topic: 871 Message: 871

g'day all,

i have just been told by a codan repairer that my codan is out of warranty
i purchased this unit brand new out of the boxes about 2 yrs ago, and was told 3 yr warranty.
i am since told by codan agent, unit was made in 1997, and therefor out of warranty.
i thought warranty was from date of purchase, not date of manufacture.
anyone else had this happen to them? any other thoughts appreciated.
my codan is playing up, and i was going to send it in for repairs.
my dissapointment runs deep.
regards,
paul lefevre

Paul
He is having a go at you. Yes it is from day of purchase. Threaten to go to fair trading (but you must be prepared to back up your threat) and hopefully he will sing a new tune. Have you tried ringing Codan's head office and talking to a manager. Threaten him with this too. He would not like to lose his "prefered repairer" for Codan title. You will win with fair tradings help.
Regards
Keith

hate to be the bearer of bad news .... Those tubes are near impossible
to find.
Your only choice is to glue it up if the break isnt in a million pieces.

875. antenna stuff

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-09-01 08:01:40 UTC
From: Ben Hobson
Topic: 875 Message: 875

Leaving the option AD in wont hurt when using a tapped whip as the control cable has no function.
It must be removed if using a 8551 control box or a 9350 antenna

Ben

Jim wrote

Hi Greg, didnt mean to sound upperty, just trying to help :))
Yes you can attach a whip. Now I'm not sure here, someone will jump in and correct me if I'm wrong thats for sure ! (I don't mind because I learn stuff too). Personally I would remove the
ad board before using the whip. Not sure if you have to. It only takes 3-4 mts.
Make sure the whip base is grounded well.
Cheers

G'Day Paul,

You don't have to use Fair Trading or anything such.
Simply call Codan. Their customer service is excellent.

I called them up when the dealer who sold me my "as new" 4 month old
unit without the fibreglass whip and then tried to sell me the whip
separately.
He's still feeling the whiplashes on his rear end and Codan
couriered out the whip to me within 2 days.
They also registered my NGT as new under full 3 year warranty.
BTW, if anyone is interested in knowing who this "great" dealer is,
hit me offline.

Regards

Ari

MMmmm - very sad..anyway the break is pretty clean so I have glued it - seems OK...put everything back together and still no joy. The internals seem to be doing their thing as you can feel a vibration when tuning (or trying to tune) and a bit of a noise. Something else wrong?? Also for extra reinforcement can you apply tape/coating to plastic tube and not affect performance (not that I have any as yet but just in case I get the b*tch going)?

Also tried a whip antenna with the AD card still in. When carrying out beacon call comes up with tune fail or not tuned (cant remember now) - is this normal or is this indicative of a problem. Unit appears to work fine with card out on whip i.e. no error messages and can Rx OK.

Thanks for your help
Cheers

Ahhh, the joys of autotunes. I've done a few here and I can tell you that I always worry until the owner has contacted me with a "Yippee" :)
Sounds like you have done all the things suggested on Bens page and still no go. If this is the case, try and make sure that the RF actually has continuity through the coil. Perhaps the contacts arent working or are dirty ? There's a couple of springs that are small and fall out if not careful At this stage I'd rethink a bit. Take the radio top off and do a beacon call checking the temperature of those driver transistors again. You can burn a finger on a crook one so be careful.
Also check that your cable has continuity. Might be a wire off a plug. (unusual).
Cheers
Jim

Greg,

I run an 8 meg whip on the front b/bar in addition to an 8558 on the rear. The whip is short enough to make it into carparks and is the freq that I use most often.

All I do is swap coax cables at the 8525 (baby 8528), leaving the 8558 control cable connected. I DON'T touch the TUNE button ever when running on the whip, and obviously am switched to 8 meg for Tx/Rx. I get no untuned error status from the radio when doing this.

I figure the whip (8022) would be fine on 2020 (or any even multiple of 8022) too if needed, but haven't ever tried it.

Topic: 880 Message: 880

Greg

You should be able to apply some tape or something to the tube. As long as it doesnt foul on the spring contacts it will be fine.
Obviously the PA is putting out power if you have a successful selcall on a tapped whip
Undo the connector at the antenna end of the cable, broken wires arent as uncommon as Jim suggests
The autotunes dont fail electrically that much (unless you reversed the connectors when putting it back together?) Its usually a mechanical fault as you found. 90% of tune faults are the option AD board.
It would be handy if you knew someone close by to try your antenna on their radio to eliminate one or the other
Or replace the BD675 transistors and the other smaller ones on the AD board and see what happens

schematics of the AD board and control cable are on the website

Ben

881. Query 8558/9350 grounding

Yahoo group: codan_outback_radio (1997 — 2004)

I'm communications officer for a UN mission in northern Iraq. We are using CODAN radios for base-to-mobile operations in both short distance mountainous areas as well as long-distance desert areas.

In my fleet we are using 8528 xcvrs with 8558 or 9350 antennas, mostly front bumper mounted. Almost all were fitted only using the short grounding braid supplied, as grounding to the antenna. The vehicles are mainly Toyota Landcruisers.

Performance isn't very great, due to skip-distances on the allocated frequencies. I suspect lousy grounding could be an additional source to the weak performance.

Grateful for information/experience on improving grounding and what the results were.

Hi Gert - have very good performance (not at the moment though due to zero TX power output) with only the supplied grounding strap (although the mounting bracket I use is moderately well grounded to the bullbar). The freqs you are using may well be an issue - what sort of distances are you looking at for comms, and what are the freqs you are using? The terrain you are in may also have a bearing on the comms problems you are having - from the piccies we see on TV, Northern Iraq has very hilly terrain, and I have not always had good comms in very hilly terrain, particularly when close to the base of the hills - maybe your operators need to be cognisant of their surrounds, and may be better off moving their location to the centre of the valley, or to somewhat higher ground in order to get better comms. Personally I doubt that only one grounding strap will be much of an issue.

Matt

Gert,
in response to your post this is probably information that you already know of but I will note it down anyway.
try the codan website and look for the technical application notes regarding mobile installations. These notes are quite routine for a technicain installing radios but are very helpful at maximising performance for a "compromise antenna" such as a vehicle mounted antenna.
One particular useful point is the grounding strap should be braid as the current at HF is a "surface" current. You stated that the radios were only supplied with a single strap. You can make additional suitable ground straps from RG 213, RG 214 RG 8 type coax by removing the outer braid, flattenning by hand and then coating with lacquer (PCB lacquer is usually handy). you can then crimp a termination on the end but go for one with the most surface area.
It is worth at least bonding the bonet of the land cruiser, this can assist with grounding. The bonet will be at ground potential at DC but this may not be the case at HF.
Regards
Paul

Hi Gert. What a job ! Good luck. As for grounding, the autotunes do require secure grounding. Lack of ability to tune at higher or lower frequencies can be attributed to poor grounding. Also effeciency of radiated signal. Make sure that all major bits of vehicles, chassis and cab , are attached to each other. If any question there, use a strap also .
The useage of correct frequencies is something you have obviously determined at operational level. Placement of vehicles during skeds , if optional, might be another factor.
The radios and autotunes are very capable units. You shouldnt be having any difficulties except with propogation and interference etc.
Cheers
Jim

Thanks for the reply Ben - have had a play, and have unfortunately come to the conclusion that there is a problem in the PA area - the tx light does not even flicker - and a meter shows that there is no tx output at all which made me somewhat annoyed (putting it mildly - actually I was rather rude towards the radio, and codan in general). I have had a look in the pa section, and have found two "fuses" next to the relay - both appear intact, so I guess it may be a case of sweating out the tranny's and seing if they are still in a working order - if busted, then I guess I will order in some new ones, and replace them. I am a tad concerned - why would they die like that - is it a common Codan problem, or is there a potential for more problems to be the cause of blown transistors (assuming they are the problem)??

Matt

Subject: Re: [codan_outback_radio] Codan 8528 - 8558

Matt,
It is most likely one of two things.
1) No TX power
disconnect the antenna control cable, leave the coax connected
hold in the tune button for a few seconds, is the TX light BRIGHT?
If not you have either killed the PA or blown the PA fuse.look inside
the PA section near where the DC supply comes in. should be a small fine
wire fuse soldered between two pins. there may be a few of them. look
for the one with the air gap. I usually replace them with a fine strand
of speaker cable or similar

2)stuck worm drive in the antenna

Is the antenna making noises (stepper motor moving)
If not, a bit of gentle persausion may be needed, they get stuck
sometimes (percussive maintenance)

If it tunes after a few moderate thumps, I suggest its time to pull the
antenna apart for some maintenance/lubrication

If the radio sits there & beeps and the antenna is making noises, open
up the radio and feel the four BD675 transistors on the option AD board.
If they get hot during tuning attempt, you have found the problem.

Matt, I'm not Ben but here goes (deep breath). The PA stage in the Codans is pretty robust. It can be killed by a lot of things, but generally survives most silly mistakes. As far as I'm aware it is not a problem area in these sets. If you are going to play with its innards, make sure you have the schematic and some instrumentation. Not sure if you have experience, so sorry if I'm trying to teach you to suck eggs :)) I'd also take a peek at the PA transistors with a meter as you indicated. Wlhile you're at it, make sure the internal connections are secure etc
Cheers

Subject: Re: [codan_outback_radio] Codan 8528 - 8558

Thanks for the reply Ben - have had a play, and have unfortunately come to the conclusion that there is a problem in the PA area - the tx light does not even flicker - and a meter shows that there is no tx output at all which made me somewhat annoyed (putting it mildly - actually I was rather rude towards the radio, and codan in general). I have had a look in the pa section, and have found two "fuses" next to the relay - both appear intact, so I guess it may be a case of sweating out the tranny's and seing if they are still in a working order - if busted, then I guess I will order in some new ones, and replace them. I am a tad concerned - why would they die like that - is it a common Codan problem, or is there a potential for more problems to be the cause of blown transistors (assuming they are the problem)??

Matt

Subject: Re: [codan_outback_radio] Codan 8528 - 8558

Matt,
It is most likely one of two things.
1) No TX power
disconnect the antenna control cable, leave the coax connected
hold in the tune button for a few seconds, is the TX light BRIGHT?
If not you have either killed the PA or blown the PA fuse.look inside
the PA section near where the DC supply comes in. should be a small fine
wire fuse soldered between two pins. there may be a few of them. look
for the one with the air gap. I usually replace them with a fine strand
of speaker cable or similar

2)stuck worm drive in the antenna

Is the antenna making noises (stepper motor moving)
If not, a bit of gentle persausion may be needed, they get stuck
sometimes (percussive maintenance)

If it tunes after a few moderate thumps, I suggest its time to pull the
antenna apart for some maintenance/lubrication

If the radio sits there & beeps and the antenna is making noises, open
up the radio and feel the four BD675 transistors on the option AD board.
If they get hot during tuning attempt, you have found the problem.

Yep thanks for the reply Jim. Have had a reasonable amount of experience with playing with the innards of radios, so am not afraid to play with them - although I admit to having hand some over to the techs (one of my Alincos with a TX problem was a good example - I hate the extreme miniturisation of modern radios). Will have to have a play and see what has occurred - and of course fix the problem. Appreciate the assistance.

Matt, I'm not Ben but here goes (deep breath). The PA stage in the Codans is pretty robust. It can be killed by a lot of things, but generally survives most silly mistakes. As far as I'm aware it is not a problem area in these sets. If you are going to play with its innards, make sure you have the schematic and some instrumentation. Not sure if you have experience, so sorry if I'm trying to teach you to suck eggs :)) I'd also take a peek at the PA transistors with a meter as you indicated. Wlhile you're at it, make sure the internal connections are secure etc
Cheers
Jim

890. 8528 PA transistors

Matt
after servicing a large fleet of 8528 mobiles for a number of years, I have only seen a few PA failures that were caused by the transistors. They are a matched pair & must be purchased as such. Take note of where all the capacitors are soldered on when you remove the transistors! The few I have done, were just a straight out replacement of the two trannys & away the set went again (& still going)

email me off group if you need the circuit or layout. only one is on the website (cant remember which one)

Gert
100 series Landcruisers in particular are very badly earthed from the factory. It would be wise to earth every panel (doors, mudguards, bonnet) to the main body & then the body to the chassis using the methods described.
Make sure to scrape away the paint to ensure a good connection.

Another point, is the body of the autotune antenna above the bonnet line??? This may cause problems if it is mounted lower

Ben

Gert
a few more points.
Are your users aware of the 'Dead Zone' that is usually at distances of
50 to 150km between radios.
what sort of frequencies are we talking about (generally) the lower
freqs around 3 mhz will be ok for short distance comms, but 7 to 10 will
do for 500 to 1000km , depending on propagation, time of day etc.
Performance from HF is never brilliant in mountainous country, (how many
AM/ shortwave transmitters do you see on mountain tops??)
Poor grounding as per my previous post will most certainly play a part.

If Gert is dealing with relatively short distances in mountainous terrain, would he get better performance with a horizontal aerial, like the NVIS kit that Codan offer? (Download the "9350 Automatic Tuning Whip Antenna" pdf file from http://www.codan.com.au/radcom/publications/radcom_data_sheets.asp) for a good diagram of the NVIS kit.

I've been told you can achieve the same effect by removing the whip, then attaching three meters of wire to the spring, and arranging this (near) horizontally backwards
to attach to an insulated support at the rear of the vehicle. Worth a try?

Chris

Greg

I had a similar problem with the connecting tube slipping, in my 9350. I tried replacing the tube with a piece of fuel hose which worked mechanically, but apparently the conductivity was wrong and the antenna wouldn't tune. I eventually put some very compact crimp-style hose clamps on the original tube and it's now working ok.

At the time someone on this board mentioned a source for the correct type of tubing, and referred to it as having "dielectric" properties. Have a look in the archives and you might be able to track it down.

If you can track down the right stuff, I'd like to get some for a spare. Let us know how you go.

Chris
I think you & Greg are talking about two different things
Greg is talking about an older 8558 antenna and the actual clear plastic tube about 2.5cm in diameter that moves up and down as the antenna tunes. Chris, you are referring to the flexible coupling between the stepper motor and the worm drive in a 9350.
The stuff to look for is insulated at about 1000 volts, is red in color and about 6mm ID.
Look for it at a shop that sell high pressure hydraulic hose etc

Gert, as an experiment if the stations are only 75 to 150km apart and in mountainous terrain, could you just carefully "bend" your whips back to give a high takeoff angle ? A bit of twine or fishing line would be ok for a test. The vertical whips are good at low angles of radiation but you need high angles.
Try it and see if any improvement. Let us know.
Just a thought.

901. New Codan dealer in Sydney

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-09-06 04:10:51 UTC
From: apalsson
Topic: 901 Message: 901

Hi all,

Codan has a new dealer in Sydney, Karera Communications.
Karera is 3 Leonard Street, Hornsby and also in Bathurst.

I guess this is good news for Sydney siders who have had to drive to
Dubbo or Newcastle for routine service.

I have no affiliations with Karera whatsoever.

Regards

Ari Palsson
VKS R3037

If you're going to do the "bend back the whip" trick...

have the whip bent away from the direction you'd like to communicate with too. So if you want to communicate to someone north of you, flex the aerial to the south.

Hope this makes sense.

Ian B

--- In codan_outback_radio@y..., "Jim" <jimshire@i...> wrote:
> Gert, as an experiment if the stations are only 75 to 150km apart and in mountainous terrain, could you just carefully "bend" your whips back to give a high takeoff angle ? A bit of twine or fishing line would be ok for a test. The vertical whips are good at low angles of radiation but you need high angles.

Hi all,
No connection I think, but Dennis could be related. McKay & Assoc. are in Wollongong and deal with Accessories for Portable Two-Ways, Mics, Earpieces, headsets, batteries etc. remember the 2000 olympics? They supplied the headsets for the Torch relay bikes etc.

For Karera Communications, try entering "www.karera.com" this will get you to the right place. No info on Codan there yet as they only upgraded last week I think.

No connection now, except friendly chats via phone (Like this week.), but I worked at Karera for a few years before taking up a positon in FNQ.

Regards,
Sam
Comms Rigger Technical etc. etc. :-)

Thanks Ben,

I tried numerous addresses just working off their email addresses and got nothing, I just thought they may have a new one after someone posted to search on Karera and got McKay's.
Just thinking about it now though, they may have been thinking of McKay and associates in Wollongong.

Matt,

There are lots of free utilities on the net to stop those annoying ad windows from opening. Search for Popup Stopper and follow the bouncing ball. This is the application I use, is easily installed/uninstalled, easy to configure and easliy bypassed if you want the windows open.

Ben, had the same problem with the 2 we have access to at work. If they dont loosen shortly
I'll have to pull out a couple of old FM900 mic brackets with the magnets removed, they fit looser.

Sam.

Sam
you are confusing McKays & associates with McKays Communications in
Dubbo .
Up until recently, McKay's Communications (Dubbo) were the only Codan
dealership in NSW after the RFDS in Broken Hill shut its doors on the
workshop 4 years ago.

McKays Communications
25 Douglas Mawson Drive
Dubbo NSW 2830
Ph 02 6884 5237
1300 656 186

They do not have a website

Cheers
Ben

Thanks Ben. Anyone who wants to complain, the jobs yours. :))
Tried to throw an Electrophone 3400 in the 4wd today. The thing is about as big as my Codan control head. (8528). The cb is s/h and came as a local without any mounting brackets. I know I can "tie" it in somewhere but don't like the idea of it floating arround in a sudden decelleration. Any ideas?
Cheers

Thanks Ben. Anyone who wants to complain, the jobs yours. :))
Tried to throw an Electrophone 3400 in the 4wd today. The thing is about as big as my Codan control head. (8528). The cb is s/h and came as a local without any mounting brackets. I know I can "tie" it in somewhere but don't like the idea of it floating arround in a sudden decelleration. Any ideas?
Cheers

Jim - have you considered making a bracket up? I have made up many brackets from a variety of metals, the easiest has been aluminium, and the worst was stainless steel (I went through a lot of drill bits there). With a little bit of finishing off work, a piece of aluminium bent and drilled can be made into quite a decent mount - don't do to bodgy a job as you will always be looking at it.

Hi Jim, it takes only 5-10 minutes total including trawling through the junk pile to see what pieces of metal you have. Then measure, cut, bend, trim the edges with a file, drill holes, and voila, one by bracket. Paint it if you like, and all is done.

Matt, havent looked too carefully at the radio but it doesnt seem too easy to attach a homemade bracket. I could be wrong (as usual) but it looks like the insides might be packed a bit tightly to have a screw or bolt inserted from a homemade bracket. If it were my 4000, no worries but its about as big as my tax refund.....oh hang on, this year they want me to pay them ...bugga.

932. 3400 bracket

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-09-10 13:10:16 UTC
From: lr13083
Topic: 925 Message: 932

Hi Jim,

The 3400 requires the use of a special mounting bracket which uses a plastic rail that slides in the grooves on the sides of the radio and locks in place. A bit too difficult to make from scratch so I would follow previous advice and order one from a GME outlet.

I have 2 of these radios and they work quite well for their size.

happy mounting....

Geoff

Ahhh - OK, am more accustomed to the usual clunkers so made the usual assumption (bad me, assumptions are the mother of all eveils - or something like that anyway). Yep, reckon it would be better going for a bracket from GME (curse GME for going away from the norm) - unless you are feeling inventive. Back into my box I go!

Matt, your input was appreciated anyway :) I've made a few brackets for Codans etc but this was just a tad out of my ability range. On that topic, I have a Codan mounting bracket with no bits that lock the radio into the bracket (just round holes where they used to be). I guess these are probably still availiable from Codan at great expense but anyone have any other ideas ?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-09-11 07:47:05 UTC
From: Mick Barson
Topic: 938 Message: 938

Guys,

as the header states, My 9323 wont turn off...was working fine whilst we were away, Havent used it for a week or more and I just gave the dash a wipe over with some spray on vinyl cleaner and a cloth and accidently turned the control unit on, and it wont turn off, pushing the on off button the screen goes blank for a second and then starts up again....any ideas? I didnt drown the control unit or even get it slightly wet..

Cheers
Mick

Not sure on the 9323 Mick, but earlier series turn off was basically the eprom and control circuit. I'd try disconnecting the set and then reconnecting it. If that doesn't fix it, its a shop job.
Anyone else ?
Jim

OK thanks Jim, Its working again....I turned it off and spun the freq knob around [the only thing that was altered when I wiped it over] and turned back on and all appears fine, hope it stays that way ...Dunno what the cause was or how that fixed it, but Micks a happy chappy.

You could try some industrial strength double sided tape. I used to use it all the time on heavier radios and it never comes off. The tape is a a thick rubber type tape with glue bubbles in it that burst on contact. I used to use it to put the big advertising boxes on top of taxis. The stuff will hold anything even on the rough roads it wont fall off.

Brian.

Thanks Ben. Anyone who wants to complain, the jobs yours. :))
Tried to throw an Electrophone 3400 in the 4wd today. The thing is about as big as my Codan control head. (8528). The cb is s/h and came as a local without any mounting brackets. I know I can "tie" it in somewhere but don't like the idea of it floating arround in a sudden decelleration. Any ideas?
Cheers

Hi folks

I am another list lurker. Last year, I picked up a used 9323 and auto-tune antenna and these are still in their boxes. My AU Futura s/wagon currently has Tait VHF mid-band and TU band UHF, a 2m/70cm duobander, a GSM and a CDMA phone and a Vodafone GSM/Globalstar satphone .. and a GPS !

Can Sam, Ben or others suggest how I mount the Codan antenna on a station wagon ? The vehicle has a TJM alloy bullbar which probably won't support the antenna ... and if I use the tow-bar, I can't open the tailgate ..... Any ideas based on your considerable expertise ... ?

Or do I sell the Codan and use a Barrett 940 Packset as a portable ? (SES has 5 of these !)

Peter

Hi fellas and gals
Has anyone on the list used a Kaymar Codan aerial mount that goes with the Kaymar spare rear wheel carrier?
I have a 100 series and am buggered where I can mount the 9350 autotune on the bullbar. I have a price for the mount from Kaymar, but if anyone can tell me anything about it, I would be grateful.
I am also thinking mounting it on the rear will keep the aerial leads away from electrical interference in the engine bay.

Hi Peter. I'm one of the others :) I've seen the aerial mounted on QLD Police station wagons at the back. The bracket is made in SA ? I think. Looks expensive, lots of chrome. Hooks around the top, has stay and not sure what happens down the bottom. I think Ben is on holidays and may be away. Anyone know of a source for these station wagon mounts ?
Cheers
Jim

Gday Keith,

Kaymar make 2 types, one that fiited into the wheel hitch [between wheel and tailgate] and a newer type that fixes onto the Rectangular tube that is part of the swing away. When I fitted mine there was only the 1st type and I didnt like it as it bought the aerial too close to the tailgate when using 285's [tires] So I made my own using solid square bar and pressed a slight S into it to clear the spare and the tailgate, it slides into the Kaymar work light Sq tube, I have twin carriers so my work light is not affected, and the 2nd option wont fit with twin carriers Ive been told. I have a photo I can send you if you like.

Cheers

Peter
I too have a falcon station wagon,
what i did with mine was mount it on the 'bumper bar' part of the
bullbar above the blinker
Yes it does partially block the headlight and sort of sits in front of
the bar itself as a target for skippys, but it was about the best I
could come up with.
The AU bar is a bit different to my EF, so I imagine you could have a
bracket welded on somewhere.
The bar should certainly be strong enough to support a 9350 (?) autotune
I remove the autotune when I'm running around town, and only put it on
for trips.

ben

Keith,

I also have a 100 Series and wondered where to mount the tuner base when I got it as the wife refuses to have it on the bullbar (she reckons it blocks her vision). I had a look at the fitting for the spare wheel and didn't like it for a couple of reasons being sloppy cable runs, difficulty when having to change or remove the spare wheel, and the fact I have the hi lift jack there. The other option available when I fitted mine was an angle adapter that fitted over the Kaymar swing bar that the spare wheel is attached to. They are available in Left and Right configurations. These are a strong mount and fit fine next to the spare wheel. The only real problem with them is the base is still under the height of the roof so it degrades signal strength I believe. This also has an advantage of not wiping out the tuner base when you go under something low. Kaymar has also recently released another device that fits on the swing bar and is about 700 mm tall. It sits behind the spare wheel and the tuner base sits on top of the device. I don't have the part numbers but they should be on the Kaymar website or available thru your Kaymar distributor.

Brian.

Jim,

There are more than a few around. Dick Smith have a few in the catalogue that deal with HF mainly for amateurs but HF is HF really when it comes to the basics of it. I also bought the Penta Marine Radio Communications Manual that has a lot of good HF information in it. Once again it is focussed on Marine HF but the basics are there.

Don
Are you a member of the VKS radio network? Someone associated with the network has just finished putting a book together. Might be what your looking for. Anybody have further info?
Regards
Keith Aller

Hi all
I am new to the world of HF having purchased a Codan NGT 12 months ago, but due to cancellation of a trip never really got to use it much, yet. I have been "lurking" for a few weeks and that time I have seen a couple of posts relating to mounting of HF antenna.

I had a bracket made for mine by CJ4WD in Ferntree Gully, Melb. It fits behind the spare wheel of my GU Patrol. The cables run down the arm of the bracket and enter the vehicle in the centre of the rear door then into the vehicle next to the cabling to the eyelevel stoplight and onto the "black box" which is behind the rear seats on the cargo barrier. The top of the antenna base is about 30cm above the vehicle roof.

Photos are on http://users.bigpond.net.au/ronshirl/hf.htm

These may provide food for thought.

Ron & Shirley

Hello Peter, well at work we use a bracket that goes onto the Ford swan-neck, held on by either a towball (The long shank ones.) or an equivelent size bolt. The bracket offsets the 9350 off to the passenger side, between the number plate surround & the tail light to make it legal. :-)

This bracket has a pivot pin and a locking pin. Unscrew the locking pin handle 1/2 way and the end of the bracket and 9350 antenna rotate backwards towards the ground away from the tailgate. It doesnt hit the ground but sits at 45 degrees tilt. Unless the pivot stop pin is broken that is!

I'll try and get some photo's of one of the units plus measurements and email it to you next week so you can engineer one up if needed. PDO today and on hols from 20th but I'll squeeze it in.

Regards,
Sam

Hey Jim, I don't know about those chrome ones, our QPS ones are plain black painted steel with a large "D" shaped handle to rotate to allow tilt over! Must have been SE Queensland, they seem to end up with all the flash items. We are now, due to some bright sod down south are now getting supplied with 4WD Hilux's (And possibly the rest of the 4wd fleet.(lc100's, lc78/79's, jackaroos etc.) fitted with PLASTIC BULLBARS, made of polypropelene by a company that makes water tanks in SA! you can only mount a SMALL 27 mhz or UHF cb antenna on the accesory bracket you can only purchase from them. They call it a "Smart bar" as it is safer for a head to hit!

Then you have to find somewhere else to mount the 9350's. Not that easy on most 4wd's we use.

Regards,
Sam

Hi Sam. Would this sort of thing suit 4wds without a rear carrier? Just wondering if its a way of getting the autotune off the front.
Cheers
Jim

Sam, had to laugh at that post. Yes the chrome was towards the top bit of the mount (technical term) and although I inspected it at the time , I dont remember much except how expensive it looked. (and what a great job it was doing.) And you're right, it was a Bris based unit. The car had done a few trips west but looked immaculate...(I rekkon their idea of KP is probably to have some poor officer clean the vehicles:)
Plastic eh? I've always admired the gear you pro's have.....until now. Up there they would probably be about as useful as an ashtray on a motorbike. What's next? Govt 4WD's made of foam ? Think I'd better stop there, this is a radio forum. Just wish I knew where those supports were made.
Cheers

Not many of the Bris sedans or wagons would ever have a Codan
Jim....mainly CIB types from the west down on jobs.
Sam are the mounts made by Allied Trades or commercial?

From memory they would be 10mm+ and that is probably more than the depot
would have the ability to bend.

This guy keeps changing email addresses. The only way to ban him properly is to have any new member Ok'd by one of the moderators. That would be a PITA for anyone wanting to join the group but we may be forced to do it. In the meantime just disregard any similar posts.

Hi fellas and gals
Has anyone on the list used a Kaymar Codan aerial mount that goes with the Kaymar spare rear wheel carrier?
I have a 100 series and am buggered where I can mount the 9350 autotune on the bullbar. I have a price for the mount from Kaymar, but if anyone can tell me anything about it, I would be grateful.
I am also thinking mounting it on the rear will keep the aerial leads away from electrical interference in the engine bay.

Well the 25B series head now has 25A innards. A few traps for new players, but nothing drastic. I'm not going to change the serial number plates, they're rivited.
So if you ever acquire a 25 head that doesn't work, check the number on the back. (B doesnt work with A series). Unless its mine of course :-)
Cheers

From: wildscenes
Topic: 977 Message: 977

Hi All
You may recall that I asked for some installtion tips on my new 2nd hand 8528 recently. Since then I have learned a lot about HFs as well as the fact that the aerial that came with the radio is the old 21 tap which does not cover current freqs used by vks. I need a 20 tap aerial. Anyway over the last few days an error has come up on the readout. It says Unloc Error.

What does this mean and more importantly can it be fixed?

Cheers
Miro

Hi Miro. Are you sure that the aerial doesnt cover the 737 frequencies ? Most of the old ones did, but they won't cover the current Phone interconnect services.
Unloc basically means the vco isn't happy. It's unlocked for some reason. This could range from a connector on the board problem through to a control or eprom fault. (With a lot of territory in between).
I'd check the connectors on the board first. How technical are you? Do you have the knowledge, experience and test equipment to tackle it yourself ? If not, "get thee to a technician".
Cheers
Jim

Subject: [codan_outback_radio] 8528 Error

Hi All
You may recall that I asked for some installtion tips on my new 2nd hand 8528 recently. Since then I have learned a lot about HFs as well as the fact that the aerial that came with the radio is the old 21 tap which does not cover current freqs used by vks. I need a 20 tap aerial. Anyway over the last few days an error has come up on the readout. It says Unloc Error.

What does this mean and more importantly can it be fixed?

Cheers
Miro

Unfortunately I doubt that would do all that much, if anything. I think that the only option is to make membership of the group only with the approval of the owner administator (or only able to post messages if OK'd by them) - either that or we just ignore the idiot, and make him work hard making up new identities each time he has joins a group.

Thanks Jim
Well I rang Lencom and they said that only 5044 is covered and the other freqs are not in the range. They said it will work but with limited output.

Unfortunatelly I have not seen the inside of a radio and would not pretend to know anything about it. So I guess I need to go to a techo. I think there is one in Wollongong that I can drop of to.

Cheers
Miro

Oh its a Lencom one :-) Then ignore my comments. Yes I'd stay clear of operating on other frequencies until you can find another whip or autotune.
When you ring the techo in "the Gong" (I used to live there), make sure that he knows his Codan radios. I know a guy there with a Codan but I dont think he's technical on radios, I'll check.
Cheers

The 8558 series auto tune antennas go for around $300-400 secondhand, and less if you look around and can find a bargain. A mate picked up a couple of auto tunes for around $200 at auction - oh and he got the 8525B radios thrown in as well, so you never know if you will be lucky or not. Have a look around, and you may be pleasantly surprised

Hi Miro,
If you take your 8528 to a tech who is unfamiliar with this fault,
the first place to look is the 26 volt supply on the RF mixer / Dual
Synth board. Test point 7 should be around 26 volts but I have found
that a faulty tantalum capacitor can drag this rail down too much.
Check C130 and maybe C176. Another symptom of this fault getting
worse is that it affects higher frequencies more than lower ones.
Hope this helps you a bit. C130 is a 10uF 35V tantalum capacitor.
Regards,
Michael.

Hello Jim, well it would except for the fact thet the top 400mm of the 9350 tuner body (From Spring down.) should be above surrounding metal, it doesn't seem to be affected too much on the back of Ford and Holden S/Wagons but as most 4WD's have bodies alot taller this may be a problem.

Regards,
Sam

Hello Craig, I think Jim may have run into a State Traffic Group vehicle, we sometimes see them here but generally they have a "Dunny-seat" antenna for long range comms. Mind you it could be the boys in Toowoomba trying out something, if you know what I mean :-).
I'd say the bracket was made by allied trades and it uses 6mm "U" channel (C beam.) as the main support member with a 9mm threaded bar as the main pivot. If not Allied then locally made here in TV.

If your "in" look me up on the mail (NR) and drop me a note.
Regards,
Sam

They are using random name generating software, almost impossible to block,
my Hotmail account has recently become impossible to use.
I was getting about 100 of these emails a day.
They are recognisable and deletable though...
Cheers,
Terry

Guys,

There is a simple solution to this. Membership is "restricted" ie a new member is approved by a moderator before joining.

That's the way I have my CamperTrailers list set up and we have no problems with spammers. Membership is now well in excess of 200, so it's not hampering growth either

Regards

Ari

Well I didn't actually run into anything :-) But of course I wouldn't know one from the other. And I'd like it to stay that way ! Was reading up on the Min Min lights and one report was from a guy in the stock squad? Apart from the sign on the side of the vehicles, the only time I notice them is when they have HF onboard :-) Mind you I will be looking for plastic bumpers next time I'm up that way.

Hello Craig, I think Jim may have run into a State Traffic Group vehicle, we sometimes see them here but generally they have a "Dunny-seat" antenna for long range comms. Mind you it could be the boys in Toowoomba trying out something, if you know what I mean :-).
I'd say the bracket was made by allied trades and it uses 6mm "U" channel (C beam.) as the main support member with a 9mm threaded bar as the main pivot. If not Allied then locally made here in TV.

If your "in" look me up on the mail (NR) and drop me a note.
Regards,
Sam

1005. 8525B unlocked

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-09-19 12:02:48 UTC
From: peter ostry
Topic: 1005 Message: 1005

Hi all, I recently purchased a 25B which was displaying the UL code. As per the manual, everything checks out OK. So where to next? The following descibes what I have found so far:-

1) PPL 1 out of lock light on.

PPL 2 out of lock light off.

2) Both PLL's seem to be locked.

3)For the test frequency, 4630, the following freq's were found at the IF mixers:-

PLL 1 - 49.632. should be 49.630.

PLL 2 - 43.352. should be 43.350.

Both frequencies were stable and look to be locked.

Where to look next? IC 5 / IC6??

Thanks for the forum, and looking foward to a few suggestions.

Peter.

Hi Peter,
Look back at message 989, the 8525B is the same as the 8528 (apart from EPROM and front panel). Check the test point as mentioned in that message and see what voltage you have.
Regards,
Michael.

Whilst I don't have my amateur ticket...yet (one day)the 9323 will work well as an amateur set also and has a sort of VFO with the knob to change freqs. Have tested it with a mate at the mic(VK3CAQ) and it works well.

When I first got the set, I enquired about this feature with Codan and their reply was that they were not intrested as it (the A option) caused them way too much work for not enough $$....but where there is a will, there is a way!!! Check out Ben's website for how to do it!

Mark

From: Mark Eddey
Topic: 1018 Message: 1020

Kim,

probably wont damage anything as the Codan has circuitry inside to reduce power if SWR rises. However, you will probably find that on some frequencies the antenna simply wont tune. The techos may provide a bit more info on this though.

There are a few other options for antennas, other than shelling out big bucks for the Codan SS whip. Look in the photos section where you will see that I bought a cheap thin SS whip and had a thread adapter made. Also bought a cheap spring of the Dick Smith/Tandy type. Works very well and is much more flexible than the Codan original, which from what I have read have a habit of breaking fairly regularly.

Cheers,

Mark

Hi all,

Special 73 to fellow hams Jim and Terry. 8528 is good for ham using if you are not CW fan (I'm not). I am also using Yaesu FT107M, very expensive rig at the time (some 20 years ago), and can say that 8528 has better receiving, signal to noice ratio is far better, no interference from car motors and no frequency drifting (very important for digital mode). And, of course, Codan is much, much smaller. Rotary VFO dial knob? Who cares - I like pushing up and down points. In short, Codan is better. Only thing I realy miss(beside small power on 28) is small signal meter on the front.
Well, that's it. I am usualy QRV around 14.200 and 28.450. For Jim and Terry good DX.

Cheers,

Thanks Misa. I run a TS430 on HF. I ran it mobile for many years before installing a Codan. I then found the Codan superier. So I realigned the 430. Not much difference on rx, except the Codans mute is far superior. As is the audio range.
I'll keep an ear out for you.

1024. Ham option

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-09-21 10:53:33 UTC
From: Lillian Martin
Topic: 1024 Message: 1024

Hi everybody.
I am using a Codan 8528 with the ham option and find it ok. I only use set frequencies in the ham bands (eg. the travellers net on 21.185, Sunday morning WIA news etc.etc) and usually get good reports around the country and elsewhere. While not having the best of audio controls/filtering I find it ok. Having brought expensive ham rigs and antenna the Codan does everything I need so far e.g RFDS, VKS. Amateur. Came out from work on day and tuned up 20 meters, ended up talking to a guy in France.
Will be upgrading to a 9323 or NGT next year.

From: Ari Palsson
Topic: 1026 Message: 1026

Ben, Jim, Matt,

I noticed that you permit e-mail attachments into the group. I was wondering if it wouldn't be a good idea to turn that off, as many members get the mail from the group relayed straight into their personal mailboxes and this could therefore propagate viruses.

Mail relayed straight from Yahoo groups comes without proper scanning, however if you block attachments and get members to upload files to the files section, Yahoo will scan them there for you.

Just an idea

Regards

Ari Palsson

1029. 8525B heads

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-09-23 07:35:20 UTC
From: Jim Potts
Topic: 1029 Message: 1029

Quick tip for owners of the 25B heads, not new for some but can trap new players (like me :). Firstly the 25B head will not fit a 25A. Look on the serial number to be sure.
Later 25B heads did not have the ribbon cable from the membrane to the socket. If replacing membrane be sure that the membrane fits the display card.

From: beaky41
Topic: 1030 Message: 1030

hi
recently purchased 8558 and intend to mount on rear wheel carrier of Surf. This is isolated electrically from the rest of the vehicle (by neoprene). So I guess I have to run earth back to car.

questions are

1. does this have to be braided cable?
2. best place to connect earth to aerial itself? (looks like from photo gallery connects to earth plate via allen key bolt)
3. can I paint the aerial cover (looks like fibreglass) and can I use say an enamel spray pack?

thanks in advance
bruce

Topic: 1030 Message: 1031

Hi Bruce. Yep, run earth back to car. This is an RF earth, not a normal AC/DC one, so surface area counts. Use braid if you can. Battery strapping can do the trick.
Under the end of an Allen key bolt is about the best spot I know.
As for painting, yes its made of fibreglass. But many paints have bits in them that could upset the aerial, so be careful. Remember anything containing metallic bits etc may change the tuning/effeciency of the aerial. I clean rather than paint. If anyone knows a good paint to cover them I'd also be interested.
Cheers
Jim

Hi all,

Everybody is looking for more power but not me - I
need to low power on my 8528. As I am PSK31 digital
mode fan, I need only about 25-30 watts in that mode.
Is it possible to get that kind of power when I am
using digimode? Little switch behind should be great.
Thanks you in advance for any help (Ben?).

Hi,

If you remove the covers from the radio and inspect the PA board you will find two PCB pins with writing "set pwr" under neath. This is the Power setting location.
There will be a resistor soldered between the PCB pins. If you remove this resistor and put it aside, and replace(temporarily) with a resistor substution wheel or variable resistor you will be able to set the pwr to your desired level. You can use the two tone gen. (EMER. button is a simple source.) to set the pwr whilst connected to a dummy load. Once you know of the value you need you could install a switch on the back panel with the original resistor and the new "low pwr" resistor setting - just keep leads as short as possible.

Regards
Paul

Just heard this,

The RFDS have started the "RFDS Outback Travellers Club".

Subscription is $25.00 pa, and for that you get a magazine twice a year,
plus they will be drawing 3 NGTs as prizes on the 16th December.

You need to be a member to be in the draw

Ben

Frequency Range - Continuous coverage, Transmit 2 to 18.1 MHz,
Receive 0.5 to 20 MHz.
Channels - Fully synthesised 256 channels all available for simplex
or semi-duplex.
Trasmitter - Power output, high power 50 to 130 watts p.e.p. user
variable, low power 8 watts p.e.p.
Receiver - Sensitivity 0.3uV produces 10DB signal to noise ratio.
Rgd's,
Peter.

For quite some time the Ionspheric Prediction Service - (http://www.ips.gov.au) has been providing hourly area prediction (HAP) charts on-line for the NSW State Emergency Service. These charts are valid from 20 mins past the hour each hour every day for our HF freqs - 2.5, 3.7, 4.5 and 7.3 MHz. See this site for additional Air Services Australia HF frequencies and their HAP charts.

Recently, I have worked with IPS to include other Aus-wide SES HF frequency assignments in the SES Goonellabah HAP plot (up to 14.7 MHz) and I am using these real time HF charts to justify additional/better HF channels for NSW SES.

These charts may be useful for members of this group ..

Hi Peter, wondered what you were doing. The online IPS service is a big improvement over those charts the commercial services used to get years ago from them. Nobody knew what the MUF was in one particular service, and they were amazed when I told them. They'd been consigned to the R for rubbish bin for years !
Good luck with the ACA. As you know the 737 network have been asking for years :(

Subject: [codan_outback_radio] HF Prediction Service

For quite some time the Ionspheric Prediction Service - (http://www.ips.gov.au) has been providing hourly area prediction (HAP) charts on-line for the NSW State Emergency Service. These charts are valid from 20 mins past the hour each hour every day for our HF freqs - 2.5, 3.7, 4.5 and 7.3 MHz. See this site for additional Air Services Australia HF frequencies and their HAP charts.

Recently, I have worked with IPS to include other Aus-wide SES HF frequency assignments in the SES Goonellabah HAP plot (up to 14.7 MHz) and I am using these real time HF charts to justify additional/better HF channels for NSW SES.

These charts may be useful for members of this group ..

Hi Ian. I'm not Ben but I'll butt in anyway :-). To convert a 25B to a 28 you basically just need a different eprom and head. The heads are as scarce as rocking horse you know what. I believe someone bought one but cost about 250. Having owned and operated both I'd say that unless you have a very good reason for converting, the 25B will serve you well. (and the heads smaller to mount in the vehicle).
Cheers

1055. [codan_outback_radio] 25B to 28 conversion

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-10-08 07:36:46 UTC
From: Ben Hobson
Topic: 1055 Message: 1055

Ian
some of the benefits of converting a 25B to a 28 are;
601 channels as opposed to 99
free tuning receiver 0 to 30mhz
programmable scanning blocks of frequencies (eg 7 to 7.5mhz)
direct dial radphone facility, not sure if this is usefull on anything
but some private networks now
amateur option, free tuning of transmit frequencys in amateur bands
nice pretty lcd displays frequency as well as channel number

Disadvantge is the slighly larger control head (but thinner) and the
need for an external speaker, unless you manage to find the rare & HUGE
head with the inbuilt speaker.

BUT, if its just a radio to contact the RFDS when you are on a trip then
the 25B (or indeed the 25A) will do.
The 28 is a great techo's radio or for anyone interested in general HF
listening.

cheers
Ben

1064. Codan software. Time to set the story straight.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-10-14 08:50:12 UTC
From: Ben Hobson
Topic: 1064 Message: 1064

Hi All,
I know there has been a lot of discussion lately on and off the group about Codan software and the availability of such.

1. Codan have spent a lot of time and money developing radios and software, they are priced to suit, bearing in mind the software realistically will only be sold to a handful of dealers throughout Oz. All of us here appreciate what a great product Codan have, otherwise this group would not exist.

2. The programming software copyright is still owned by Codan, it has not been released to the general public and understandibly they get annoyed when expensive software is freely and openly available on the internet.

3. Despite what may have happened in the past, I am not willing to promote the distribution of software, either privately or publicly. Whatever others choose to do, is up to them with due consequences. I personally dont have the time or money to answer questions about illegal distribution of software.

4. Various Codan staff have been helpful on this group in the past & hopefully will continue to do so. (yes they are watching.....)

No I am not being hassled by Codan, or neither do I have any commercial association with them. I am a user/fan of their product & have put a lot of time into my website to assist other enthusiasts/users.

If you dont like the way Codan conduct business, take it up with them direct instead of starting rumours here.(or buy another product)

Cheers
Ben (Moderator)

1065. Selcall numbers

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-10-15 07:31:59 UTC
From: ajbalm
Topic: 1065 Message: 1065

Does anyone know if you can change the selcall number of a 9323 or is it a "dealer only" programmable feature?

The selcall number of my set is the same as another on the VKS 4WD group & I assume I will need to change it before joining up the network.

Tony

Ben,
Thanks for your help.
May I ask in reply to your email, would the rules of copyright not also apply to the manuals & circuit diagrams you have on your site.
Codan have printed in the introduction pages of them "No part of this handbook may be reproduced, transcribed, translated into any language or transmitted in any form whatsoever without prior written conesnt of Codan Pty Ltd. Copyright xxxx Codan Pty Ltd."
Perhaps I missed the email that Codan sent giving permission for the material to be copied up onto the internet - if so I thank Codan for that permission.
I wonder if some of the other information about modifiying the radio may also be in breach of ACA regulations.
As a user group we are here to share information & help each other out, I'd like to think that the memebers dont then try to use the information obtained to commercially cut out dealers in their work.
It would be my belief that the memebers are using the information to help themselves to better understand & use their equipment - legally.
If they are using it for other than that, it would be in my opinion well outside the intent of this or any other mail list.
I can usnderstand your comments but please lets keep the group fully functional, sharing the knowledge & information with the users of the equipemnt & the group in general otherwise the site may become nothing more than a Codan FAQ site.

Tony

1067. Re: Selcall numbers

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-10-16 02:11:06 UTC
From: Mark Eddey
Topic: 1065 Message: 1067

Tony,

The 9323 can respond to up to 5 different selcall addresses which can be assigned to individual channels.

If you simply use 1 selcall address for everything just follow the instructions below and you'll be right. If you wish to use different selcall addresses for different 'groups'(ie 1 number for VKS 737, a seperate number for private channels and a different number for radio telephone use) then it is a little more complex to setup, requiring access to either programming software or by shorting the TPE link inside the set and re-assigning various channels to vaious selcall groups. It's not hard, but can be done. Check out Ben's website for how to access the TPE link.

Try this - press the 'mode' button repeatedly until you get the 'setup' menu. Enter 211 from the mic controls. You will see the number of the selcall group...probably 1. Change your selcall address here. Rotate the 'select' knob to scroll between the 5 selcall addresses and enter the required selcall address for each 'group'. Then you need to do as mentioned above and ensure that each channel is assigned the correct selcall group.

Contact me direct if you need help with this.

Cheers,

Mark

Date: 2002-10-16 06:07:00 UTC
From: Ben Hobson
Topic: 1064 Message: 1068

Tony

I do in fact have permission from Codan to have the manuals on my website. They were sent to me by
Chris Levingston of Codan. I can supply you his email address off group if you wish to confirm.

Apart from copyright issues, having the 9323 sofware (XP) out there is an issue between Codan and the ACA, having people programming radios on channels that they are not licenced for.
The 8525/28 software has been OK'd to be 'public'

As far as the modifications on my website go, only one (the AM mod) is not a Codan designed mod.
As it is a mod designed for experimentation only, and really would only be of use to amateurs and the CB band.
Its not a real big issue as far as I am aware. If any ACA regulations were/are being breached, I am pretty sure I will hear about it...

As far as the content of discussion on the group goes, the home page of our group says

"For discussion of all aspects of outback radio use in Australia, Royal Flying Doctor and four wheel driving emergency Communications For dealers, traders and owners to swap, sell, and buy new and used Codan communications equipment, services and software, and for users to discuss use of and experiences of Codan products, and people who would like to learn a little about Codan Products before Purchase"

If you read the archives going back a few months, you will see the discussion is wide & varied and members do help each other out.

cheers
Ben

1069. are there internal fuses in a 9323

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-10-21 09:12:56 UTC
From: ajbalm
Topic: 1069 Message: 1069

Are there internal fuses in the 9323?

One of the two 9323 radios I have received does not power up.

Both radios present a relay clicking sound when you connect the power to the set.
Radio 1 powers up when you press the on/off button on the remote, but nothing happens on radio 2 when you try to power it up with the remote head.

I have swapped the heads to no avail - both the heads power up radio 1 so I believe the remaote heads are ok.

thanks for the help

Tony

I found the fault - it was a blown fuse on the A pair. Has been
replaced & working fine now.

1071. Seeking ideas on mounting the 9323 remote & 9350 autotune?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-10-22 12:34:32 UTC
From: ajbalm
Topic: 1071 Message: 1071

Has anyone mounted the 9350 autotune aerial on a 100 series STANDARD landcruiser?

My cruiser has a factory fitted comercial bull bar on it. I could mount it on this but will need to weld a bracket out the front as to mount it on the existinig aerial bracket would prevent opening of the bonnet. A bracket & aeral out the front seems a bit unprotected & a bit of a big chunck of aerial out there. I have the double barn doors at the rear & dont have a tyre carrier to mount a bracket on.

Likewise, where have members mounted the remote head in the 100 series STANDARD cruiser?

Any ideas &/or pics greatly appreciated.

Tony

Tony I have the standard 80 series and an 8528 which is similar. I welded a bracket on the bullbar and put an 8558 autotune there. Apart from the legal issues (grey area I suspect but if anyone walks out in traffic and hits it...) the biggest problem is the view of the passenger. I'd much prefer it on the back but without a decent tyre carrier there its easier at the front. Another problem with them at the back is forgetting the whip is on when under trees, garage roofs etc. Apparently the sound of breaking flouros is pretty exciting !
The head is mounted to the drivers side of the transmission tunnel. Easy to get to but you need to take your eyes off the road to change anything. Easier than it sounds, but I have been known to stop and adjust channels etc.
Cheers
Jim

From: Jim
Topic: 1073 Message: 1073

For those that didn't catch this news item. Says a lot for carrying some comms. Or even getting the 4wd hire companies to put an epirb in the glovebox.

"Stranded German tourist airlifted to safety

A 36-year-old German tourist has been found stranded on the remote Canning Stock Route in Western Australia's Pilbara where he had been bogged on a salt lake for three days.

Police say Kim Hardt had purchased a map of the route in Germany and set off from Wiluna, about 700 kilometres north-east of Perth, on his way to Darwin.

His hire car became bogged on Lake Disappointment in 50 degree heat, where he was found by a group of tourists with only one litre of water, 10 litres of beer and a packet of biscuits

Newman police Senior Sergeant Steve Gosney says the man has been airlifted from the area by a helicopter sent from the Balfour Downs Cattle Station, about 100 kilometres east of Newman.

"The gentleman concerned was extremely lucky because when he was actually found he was sipping on salt water, so he'd used his all his fresh water up," Senior Sergeant Gosney said.

"He was very lucky to be found. He'd been stranded out there for three days." "

Cheers
Jim

From: Sam Point
Topic: 1074 Message: 1074

Hi all, just thought I'd drop a couple of quick ones in.

1: Control head mounting points in 100 series LC's
In standard LC100's heads are mounted on top of ashtray on bottom of dashboard in front of handbreak lever. Or make a bracket to go in the pocket under the standard car stereo, the head sticks out and does partly obscure clock etc..
In GLX LC 100's head mounted infront of gear lever below cigarette lighter on black gear lever surround moulding.
Note: all these installs are in Government vehicle, so ashtrays and lighters aren't used. Mounting points DO NOT block access to accessory power sockets.

2: And you thought you had problems mounting your CODAN 9350 + 8525/8528 in your Landcruiser/Patrol/Land Rover/Station Wagon!!!
This afternoon on my way home from the office I saw a very strange sight! A red Holden Barina, you know those small sub-compact shopping cars (Powered by 4 guinea-pigs on steroids!), overtook the trusty Troopie. Mounted behind the bullbar on the front of the car was a CODAN 9350 Auto-Tune antenna and mounted at the bottom of the dashboard was the control head. I don't know where the tranceiver was mounted as I could only see so much.
I think if you went to transmit whilst driving the vehicle would stop as they don't have very big batteries!
I'll try and get some Photo's, with the digital camera which I aim to carry for the rest of the week just in case i see it again, and upload them to the site. The spring section was about 400mm above the roof, what a strange sight.

Regards
Sam.

From: ajbalm
Topic: 1074 Message: 1076

Sam,
many thanks for the info & I look forward to seeing some pictures.
I am in the process of making a mounting bracket to weld onto the bull bar for the aerial. Plan is to put it on the LHS over the top of the headlights. The standard aerial bracket that comes on the comercial bar is too close to the bonnet - infact with the 9350 mounted there I cant open the bonnet. I have been told that there is a likelyhood that the weight of the 9350 will cause the weld to tear the bullbar & I must also weld a strengthening gusset between the bracket & the bar - any ideas/comments from experience.

I basically had come up with mounting the head in front of the ashtray. Unfortunately we use the lighter plug to power various chargers eg Compaq Ipaq, phone, GPS, CD players for the kids etc. Both the 12 Aux outlets are also in use - perhaps I could mount another cig lighter plug because the remote head does sit very nicely ontop of the ashtray.

The control box - I am toying with making a shelf up the top of the rear area behind the cargo barrier or alternatively mounting it on the cargo barrier. I figure the cables will run inside the plastic body moulds ok - a big hole will need to be made in the firewall for those plugs though.

The fitting is the easy bit, deciding where to put it all seems to be the hard bit.

thanks again
Tony

Tony,

Had some of the same problems as yourself. Have a look at some of the photos on the website and, if possible, post yours when you've got it all up and running.

Always interesting to see how others fare..

Cheers,

Mark

Tony
it is fairly easy to mount the cradle on the cargo barrier. there is usually enough room between the barrier and the rear seat. Use a piece of flat aluminium on the other side of the barrier and 'sandwich' the barrier between the cradle and the aluminium.
(I should talk, my codan was just jammed behind the seat. It started out with cable ties holding it to the barrier but went downhill from there....)

the cables will run up the side trims OK
to get the cables through the firewall, there is a large grommet on the left hand side in the engine bay,
put a small slice in the rubber and feed the cables through. the coax will go easily without the connector. Take the plastic shell off the radio end of the antenna control cable. fold the plug sideways and tape it all up, to make it as compact as possible & push it thru from the engine bay side. Alternately, cut off the D range connector and resolder it after feeding it through the hole. The 9350 cable only uses a few wires.

No need to drill extra holes in the firewall. Just silicon up the grommet when the cables have been run
(the DC cable can also be run through this grommet, but good install practice is to run the antenna cables on the opposite side of the car to the DC/control cabling) You should be able to feed the DC through where the bonnet release cable runs.

From: Jim
Topic: 1079 Message: 1079

I'm sure a few of you can relate to this :)

Why you don't put an auto on the bullbar.
He wore thongs, a white tee-shirt over dirty shorts and wobbled towards my bullbar. I watched him from the drivers seat as he stopped, scratched his head,did a little dance, stopped, looked it up and down again and spied me.
"Whats that mate..looks like a big CB ?"
I'd played this game before.
I tried to look amazed "Haven't you seen one before ?"
"Naah....biggest F^&*(*& cb aerial in history? Its awesome mate ...err whadisit ?"
"Flying Doctor"...that's something they have usually heard of.
"Oh..ok...what sorta range ya get from that "
"What sorta range you want ?"
"THAT good ?"
"Yep"
Studies the autotune as if it were alive and then walks backwards still looking at it, saying softly to himself "F^&*(*& amazing!"

Unfortunately the woman he bumps into walking backwards drops her shopping and the autotune is forgotten.

Cheers
Jim

I was just fishing around on Ebay for something entirely different and came across a 8525B radio if anyone is interested. The current price is sitting at $345 with the reserve not met. It's located in QLD. No real details on the unit. If your interested it's at http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&item=1395864055

Brian.

Can anyone shed light on the following messages that display on my 9323?

1/ The set displays a message "unknown error 0,0" not long after powering it up. The message disapears as soon as you touch any of the buttons/knobs.

2/ A message occasionally flashes up "Unlock error VCO1"

3/ When the Autotune is tuning the power output does not step down (As seen on the remote head display). I am told it should do this to protect the set in the event of a broken aerial or coax cable. (I had a look an another set & it does do this on the second set)

The set seems to be working fine despite the above.

Has anyone done the GPS upgrade - do I need to send the set away or can it be done by me, ie just enter the unlock code?

Thanks for the help

Tony

1083. cant access the photo's

I can access them this morning.
Maybe a yahoo problem recently???????

Thanks for taking the time to check the problem.

Yep, I can get into them today.

Perhaps Yahooo should have another possible cause "system error"

Tony

1088. Earth braids and aerial bases

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-11-09 12:06:48 UTC
From: Jim
Topic: 1088 Message: 1088

First let me declare that I do have an interest in the website.
Anyway, there are some nice earth braids for autotune earthing at
http://home.iprimus.com.au/jimshire/bushman/goodies3.html
stock number 34.(I didnt write the ad btw !)
Also I have a question that you may be able to answer. I picked up a whip base at a hamfest, and it appears identical to the Codan one with one exception. Instead of a straight coil , its shaped like an old coke bottle, similar to the ones found on early cb 1/4 wave aerials. Very common with amateurs using the Codan amateur aerials.
Are these a Codan product ? Anyone care to comment on how they last etc ??

Cheers
Jim

1089. Acquired some Codan gear

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-11-12 23:26:28 UTC
From: the_xo
Topic: 1089 Message: 1089

I have just closed a deal for some Codan gear.
I have a Codan 8525 (not the remote head version)
It appears to have 6 channels Programmed in. (no freq card, anyone know an easy way to check it's freq's?)
2 Codan 7727-TB with Code 619 Control Heads.
They all have (presumably the same freqs. One of the 7727's has a four digit number stickered on which I assume is the selcal code and a freq card showing it to have 2020, 4010,5300,5410 and 6890.
I assume they all have these freqs as they came from the same company. (Went satellite). Units have been in storage for 2 years.
All the units seem to be in working order (power up and rx ok) and I also have Codan base station PSU's for the 8525 and one of the 7727's, plus a Kenwood PSU for the other.
All in all a very good haul. :^)

So, I am now looking for:
Programming info and/or software, manuals/service info etc etc.
I believe the 8525 has eproms and they are removed and programmed then replaced, no idea about the 7727's.

7727's are crystal controlled. You need to purchase crystals to change
channels and then re-tune them
They are only up to 10 chanels anyway

85xx series are Eprom controlled

http://ozradio.wireless.org.au has all the info you need

Yes, xtals fitted are hi side receive, (TX Freq + 1650Khz=Xtal Freq) and
they beat that against a 1.65Mhz oscillator to get the TX freq, instead of
using a separate tx xtal. Clever.

> They are only up to 10 chanels anyway

The tuning components are only fitted to 8 of the 10 channel locations, so
looks like max of 8 for these particular rigs.

> 85xx series are Eprom controlled

yes, I think have an 8525A model so can't do too much apart from the extra
channels, but still a very good catch....

> http://ozradio.wireless.org.au has all the info you need

Yes, found it already, thanks for responding, I appreciate it....

You can see if the 25 is an A model by checking the serial number which will start with an A if indeed its that model.
The A model is still a very reliable basic tranceiver. Although many people want more channels than the 99 availiable, its problamatical if they could ever actually use them unless its set up as a base.
The 25A can be fitted with an 8551 and 8558 auto tuner to make a solid little setup.
Cheers
Jim

Ok, that confirms it the serial is Axxxx so it's an A model. Thanks...

> The A model is still a very reliable basic tranceiver. Although many people want more channels than the 99 availiable, its problamatical > if they could ever actually use them unless its set up as a base.

True enough. 99 will be sufficient, that will take all the RFDS and 737 channels we are likely to need, plus a few other RX only etc.

> The 25A can be fitted with an 8551 and 8558 auto tuner to make a solid little setup.

Yes. That's what I thought. Thank you.

Having trouble finding much on the 7727's. It's xtal locked of course, not as much scope, but still a nice unit. Would like to fully check out their selcal capabilities, so looking mostly for documentation.

Cheers

Geoff

From memory they need an external selcall unit (the 7727 that is) - I have one floating around here somewhere (just in the middle of unpacking from a removal at the moment, so it could be anywhere), but not sure if it is the correct model - there were a couple of external selcall boxes made by codan. I also have a friend with a couple who may be willing to dispose of them if you need more than one.

Mine have internal selcal, both 7727-TB's I have here are fitted with selcal boards.
One seems to have been a retrofit as it is an earlier S/N than the other one, but has a later version of the selcal board.

> I have one floating around here somewhere (just in the middle of unpacking from a removal at the moment, so it could be anywhere), > but not sure if it is the correct model - there were a couple of external selcall boxes made by codan.

Perhaps for one of the 66xx series radios rather than the 7727?

> I also have a friend with a couple who may be willing to dispose of them if you need more than one.

No, all 3 radios have selcal fitted thanks for responding though....

To qualify as a boat anchor they should contain valves.....you know, those
glass things that glow...

I have a couple of 7727's myself, apart from being xtal locked, they are not
bad, and they come with a remote head.
Nice for emergency yelling for help at worst...

Hmm, thanks, will take a look.

> VALVES ? Marconi and I were mates and he didn't mention valves. :))

LOL. Valves are still good for some things. In xmtr finals they are good
since no amount of high swr will kill one.
Unlike semiconductor output stages. I've output valves looking into very
high swr's etc because some %^&* pinned a coax cable, it got hot (like the
plate was glowing red), but still worked afterwards. A solid state rig on
the same antenna had died rather quickly.

> Anyway, the last lot I had here were so bulky that I thought they had
valves in em. Or was that the cables....
> Like it says in the good book, and on the 6th day he made 8525's ...

Ah well, all good radios for their respective eras I guess.

Cheers

Geoff

Hi Geoff, my post was meant to be irreverent. Those who know me would understand why. I'm actually from the valve era (and yes I'm still alive, just). In fact I've still got a scar on a finger from a nasty 1kw tx that burnt me. Anyone from my era would of suffered a few tickles that would probably kill us today, and thats why I was so pleased to see solid state gear.
Another excellent use of "tubes" today is in some audio gear. Opened sons guitar head the other day and there it was, merrily glowing at me, surrounded by solid state. Shock horror :))
Cheers

LOL. well, I suspect I might be younger than you but I also am from the valve era, though perhaps nearer the end of it than the beginning. I probably got an earlier start than most in that I was playing with valve radios etc when I was 10 or 11. I still have an FT100 that is hybrid.

> In fact I've still got a scar on a finger from a nasty 1kw tx that burnt me.

Can't show any from the stuff I worked with later. 10Kw tv xmtrs tended to leave rather more than scars..

> Anyone from my era would of suffered a few tickles that would probably kill us today, and thats why I was so
> pleased to see solid state gear.

No argument that it's better for most things. I recall though one incident from the cold war era. A Russian pilot defected in his Mig 25 and flew to Japan. The Yanks kindly shipped the aircraft back to the SU - after they had examined it rather closely. They were reduced to chuckles because all the radio and radar gear in the aircraft was based on subminiature vacuum tube technology instead of solid state and they thought it rather funny that the poor Russians didn't have much in the way of solid state technology if they were still mucking about with this.

The penny didn't drop until some indeterminate time afterwards when someone twigged that vacuum tubes are not affected by the electromagnetic pulse accompanying a nuclear explosion that will 'zap' solid state stuff unless it is specially designed and hardened.

> Another excellent use of "tubes" today is in some audio gear. Opened sons guitar head the other day and there it
> was, merrily glowing at me, surrounded by solid state. Shock horror :))]

There are actually computers around that use a valve amp for the embedded sound. Class A amp presumably.
Interesting concept, sort of reinventing the technology...

Cheers

Geoff

Thanks to all the members who gave suggestions as to the possible causes to my problem. It ended up being a fault deep within VCO 1, and with profesional help, it was repaired.

Jim et al

Have a look at McIntosh Audio gear (www.castel.com.au) at the upper end
of the market but built for guys like you that understand valves :-))

Cheers

Craig

1113. Codans for sale

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-11-27 00:20:08 UTC
From: Jim
Topic: 1113 Message: 1113

Hi Guys. I have become aware of the following Codan gear for sale. Does anyone have any interest in it ?
10 * 8525-B
4 * 8528
4 * 8551 recon. mobile antennas
8 * long wire tunners, Codan parts, Matches impedance & adds Inductance and put into small inline box.
4 * 7004 single channel recievers
4 * 6924 tucker box radio RFDS * 10 ch
4 * 7515 10 channel 50 watt could set up like tucker box with addition of tunner.
1 * Barrett 550 in alulite box all as new

Cheers
Jim

Possibly the above items, depending on location and price. Where and how
much?

> 4 * 6924 tucker box radio RFDS * 10 ch

Are these SSB or AM?

Ok guys have determined some info about these units. The 25B's and 28's are essentually local units in excellent condition. Prices and an email address (Canberra) are as follows
10 * 8525-B $450 each
4 * 8528 $700 "
4 * 8551 recon. mobile antennas $300
8 * long wire tunners, Codan parts, Matches impedance & adds Inductance
and put into small inline box. $ 100
4 * 7004 single channel recievers $80
4 * 6924 tucker box radio RFDS * 10 $100
4 * 7515 10 channel 50 watt could set up like tucker box with addition of
tunner. $100
1 * Barrett 550 in alulite box all as new $1300
Modems to suit above 923

Please email Julian at Royale042@... for further info. Hope this info is of some use to someone.
Cheers
Jim

G'day all

Could any one tell me a supplier for xtals for my Codan 6924 and my 7727tb I would like to fit these out with VKS CH 2 8022 (xtal needs to be marked 9672).

Also could any one tell me if I could swap the 8002 in my unit with a 8022 with out retuning it is only 20khz the difference but I dont have any equipment to retune the units. or does any one know a way to tune these units with out much more than a multi meter and a SWR/Power meter this is all I basicaly own for HF equipment.

I would also like to know if I can use the tap on my whip which is marked 8002 on the 8022 channel.

Last on the list is can anyone program a new eprom for my 8525A with VKS 737 RFDS ABC radio and BBC if some one could give me a price preferably with out having to send my existing chip off to you.

Kind regards

Robert

Topic: 1123 Message: 1123

Hello - have the above-mentioned power supply conneted to an 8528.
When I hit the 7113 "power on" toggle switch the 8528 cranks up!
This, to me, does not seem right - is this normal/OK or is there
something wrong within the 7113 unit. Will I eventually fry something?
Regards
Greg

From: Ben & Rachel Hobson
Topic: 1123 Message: 1124

Greg,
depends on what state the processor in the '28 was when it was switched off. Try turning of the radio with the power on/off button & then turning off the supply. Turn the supply back on & the radio should stay off. If the radio was on & the supply lost, it will usually power back up when the supply is restored
Is it a local or remote set? I have seen some remotes that will not switch off, turned out to be a broken wire in the control cable

cheers
Ben

Hi All,

Has anyone come across a local control 8528 that switches it self on intermittently. Doesn't do it with the keyswitch membrane unplugged from the board , but I can find nothing wrong with the keypad, I have removed the front label and the membrane from the metal panel but it still does it. No leakage across any of the tracks or to ground.
Anyone got any clues.

Ron.

Ron
Unfortunately they do that from time to time, the panel heats up/cools down and distorts enough to switch it on, not much you can do about it, but replace the whole membrane panel. The on/off being most commonly used, all the springiness (is that a word?) goes out of the membrane around the switch and the contacts are ultimately closer together. You could try and isolate the on/off switch from the matrix, and just wire up an external push button switch. I dont like your chances of finding a 2nd hand membrane panel, and I dont know if Codan still have any

cheers
Ben

Hi Ben,

I have actually removed the front membrane which contains the shorting contact part of the switch from the front panel which leaves the open switch contacts, with just that part plugged in it still switches on. Flexing the membrane, which I can do, as I removed it from the metal front panel, doesn't cause it to switch on. It's got me tricked. I've check D3,4 &5 I can't see anything else that should effect it.

Ron.

1129. HF Crystals

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-12-06 05:39:47 UTC
From: Mazza, Stephen (HI)
Topic: 1129 Message: 1129

Hi Listers
I had a few inquiries regarding crystals I used for a 7727TB (Which I no longer own) I have finally managed to retrieve the details from my archives (Came across them by accident , actually.) I thought I had lost them.

The only details I have are that the company name is RAKON, Victoria. Phone (03) 9762 7555 or Fax (03) 9762 7999

Hope this is some value. I purchased the crystals for the VKS-737 about 18 months ago. Faxed my order and recieved them in about 2 weeks.

Stephen Mazza

Topic: 1130 Message: 1130

Well the end of the year is coming like a steam train. I guess everyone is busy attending functions, trying to get the backlogs out of the way and if they're lucky, cutting the grass.
We've just endured a 4 hour power loss, which is pretty normal for this time of the year. The only battery powered device in the house (apart from alarms etc) is the Codan base setup. Which during storms isn't the best thing to listen to in the dark :) (and so I set up the gas light instead and made tea).
Thanks for all the interraction on this list during the year, I've enjoyed trying to help out where I could, and like most of us I've learned a thing or three.
Anyway I'm getting in early before I get snowed under with cutting the jungle and taking care of freeloaders.
Have a great Xmas, hope Santa brings everyone something they enjoy.

Cheers
Jim

1133. option AD in lieu of 8551

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2002-12-11 09:26:58 UTC
From: beaky41 <bkis@chariot.net.au>
Topic: 1133 Message: 1133

Hi folks merry xmas to all

my question is can I modify my set up (8525B + remote + 8551 + 8558)
with the AD option in place of the 8551?

if so where can AD option be obtained from?

reason is I think I splaterred my 8551 and it also takes up some
room I want to get back.

bruce

Bruce
You can install the option AD board in your radio if it has the two jumper headers installed, one in the PA and one on the micro board They are each an orange 2 pin header. Most, but not all 25B's had them fitted.
Just remove the 8551 box and install the replacement cable from the transceiver to the antenna.
circuit at http://ozradio.wireless.org.au
The option AD board may be the hard thing to find.....

Hi all

Having finally acquired a 9323 I am now keen to reprogram to suit my needs ... if any one is able to assist with the software I would be grateful. Please email off list.

Cheers & Happy Xmas to all

Larry

1136. NGT Winners

From: Ben & Rachel Hobson
Topic: 1136 Message: 1136

I have just been told by Codan that the three very happy winners of the RFDS travellers club NGT's are

Mr Ferdinand Kroon
BLACKMANS BAY
TAS

Mr Ashley Williams
MOOLAP
VIC

Mr Wim Van der Leeuw
KNOXFIELD
VIC

There are 550+ members of the RFDS Outback Travellers Club so far

I dont think any of the winners are members here, maybe we will see them soon..

Ben

Hi Tony. As far as I know the explorer wasn't actually a radio but a software program to program the eprom to the frequencies of a particular whip aerial. I could be wrong here, I'm sure others will have more info as soon as they get back from the break.

Sounds about right Jim, it had something to do with the 8528 anyway,
whether it be software, an eprom or both?

Have just checked and I have the software to do the eprom. Specific frequencies think for Terlin ? aerial of the same name. Most of those frequencies would be redundant by now.
Cheers

Thanks for the replies.
Curiosity got the better of me so I phoned the number for the add in the paper for the CODAN EXPLORER HF RADIO.
It turned out to be an 8530 Codan radio with 99 Ch.
Owner wanted $1100.00 complete with RFDS & OTC frequencies for telephone calls.

In my humble opinion, over priced - majorly so. And 8528 complete with AT antenna can be had for between $1500 - $2000, see what else is available.

Hi people. I have listed an 8558, 8551 and an 8525A remote on ebay. These are being sold as I am upgrading (9323 etc).
I've also found a source of 9350's, 3 years old for $650 complete. I'll blab as soon as I can afford to buy one myself ....and yes there's more than one :) (I hope no sneeky types blab first :)
Hope you had a great Xmas.
Cheers

Dunno about brains but in short, maybe :) Your 25A has to have an 8551 controller box to work the 8558. The 8528 doesnt need the box, it uses the ad board.

Hi Terry,
they do exist and are working well.
I have been using them since Telstra ceased operations and the
service is great.

The assistance phone number is 08 8165 0052.

Regards,
Rick

Thanks Rick,

I got an answer on their business phone after a few more tries, and got
their fax on my desk just as your email arrived.
Radtel was easier - they have a website.

Thanks again

Terry

Jim,

There is a way of making the set tx from the free tuning receiver. I forwarded it to Ben and he has it on his website....try it out. I would be interested to hear how you go. I have a friend of mine who has his amateur ticket and he uses it regularly with no probs.

If you want any further info, email me off line on marke01me@...

Cheers,

Mark

Ahh does the AD board fit in the 25A?

Whats an 8551 worth if you can find one?

Cheers

Craig

The AD board only fits in the 8528, not the 8525. 8551's are not unknown, but I dont think they're all that common. In mint condition will fetch $100. There's one for sale on sold.com at the moment.

Also be aware that a new 9350 will need an adaptor if you plan on using your old cable. ie. The cable for an 8558 and a 9350 are different.

Jim,

I haven't pursued this yet...post Xmas $$ drain and all. And the next BIG trip is not till next year and even then that's only Cape York, whereas 05 is going to be Canning Stock so I want a more reliable autotune for something that remote.

Cheers

Craig

Craig, another thought for the Canning. If you upgrade the radio as well as the aerial you will have the ability to transmit your GPS position automatically. Could be handy in an extreme situation. And you can see what channel you're on instead of having to remember whats on that channel number. Don't worry, they still have the selcall mute on them :)) Besides, if you upgraded you could get the aerial and radio together, usually get a better price that way. The 28's are still very saleable.

Craig
the board will physically bolt in BUT
there are no header pins to connect the two flyleads to.
the PA lacks the appropraite VSWR sense network, you can add it, it is
only a cap or two and a resistor (I tried) but the eprom firmware just
simply does not have the ability to drive the AD board
basically, you are out of luck
Ben

Thanks Ben.
I might just unload the 21A and the 28 for a 9xxx series.
I'd loose some nice features in my 28 that many like having though :-))

Cheers

Craig, thats an interesting comment. As far as I can see upgrading to a 93 just means you lose some $$ but gain many more features. Can only think of one feature I lost, and there are ways around it. The new features far outweigh anything I've lost

Topic: 383 Message: 1178

Jim,

I have the full EPROM in mine ie all the restricted features so I can manually input any freq I want from the keypad, it is of course not the common Option A.

No guesses where I got it, but it is very handy for putting any freq you like into the 99 programmable memories.

That's what I'd miss on the 28. The head unit also fits nicely on my centre console :-))

Cheers

Craig

1180. RAM Error

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-01-09 09:27:30 UTC
From: Nigel <nigel@tropinet.com>
Topic: 1180 Message: 1180

Hi all,

Every now and then, when I turn on my 9323, I says RAM Error and
won't start up...

Has anyone else seen this? Is it likely to get worse?

Thanks

Nigel

1181. Re: 8558 /tune on an 8525A

Topic: 383 Message: 1181

Jim,

I have had both a 28 and now a 9323 and I think the feature that I
miss is the selcall test mode.

Is there a way around this? Are there other features that there are
ways around? Email me off list if required.

Cheers,

Mark

Jim,
On the 28 you can set up the selcal test mode by powering up the set
whilst holding the 2/up/slow button, then pressing s'call mute
within 10 secs. This then displays both the calling address and
the callers address without setting off alarms.

BTW my email addy is mark01me@... for any further info.

Cheers,

Mark

I haven't been using if a lot of late, but I'd guess 1 in 10 or 15
times. Turning off and back on solves the problem each time it
happens, but I am concerned that one time it won't come good and of
course it will be when I'm miles from anywhere and need the radio.

Thanks

Nigel

Nigel, I can understand those feelings entirely. Since it seems to be consistant, why not give your local Codan guy a call ? I know if I were having an occasional problem with the 4wd that I'd be hesitant to do a remote trip until I'd spoken to a mechanic.
Even local "fixes" from the group may not set your mind at ease. There's always the feeling that it may fail again just when you need it.
Given that this is a fairly complex bit of gear and the nature of the fault I'd have to recommend the dealers services. I know that this isnt what you wanted to hear but thats the best I can do.
If anyone has any other advice please step on up :))
Jim

Time to "step on up" again :
Two "RAM" type error's are indicated in the manual;
"External RAM Bad" - On power up, unable to write to Parallel RAM IC104.
"Ram Fault" - Cannot read data from Parallel RAM IC104.
As you can see both relate to IC104, which is a UPD43256AC-10L (RAM, 32k x 8 bit) semiconductor on the Microprocessor and audio PCB. This may prove to be as simple as a bad connection on IC104 if socketed or on IC101 (Microprocessor) or it may prove to be a faulty IC104.
Rgd's,
Peter.

Thanks Jim,

I just wanted to check that it wasn't a common problem with no
solution, before I go any pay my money.

Cheers

Nigel

Thanks Peter,

If it's in a socket I'll pull it out and use some contact cleaner.
I haven't got any remote trips planned for a while, so I've got time
to see if a simple fix will work or not.

Cheers

Hiyas,

Ive got a eldely 8528 radio , with very old frequencys(otc telestra
ect) programmed
would like a top 100 freq list for upto date usage,
to program the P channels.
Im sure many out there could make good use of such a list

Kind Regards

Frank

Hi Ben,

Well done, lots of useful info. I wish I had a 9323 to try it out on.
One small problem I noticed, the link to the 9323 operators manual points to
8525 manual.

Cheers,

Ron.

Hi Chris, thanks for sharing. If anyone else has some favourite tips to share I'm sure we'd like to hear them. It's amazing what you'll listen to after you've finished counting stars and wrapping yourself up in the swag. Or at picanniny daylight while breaking camp. I can remember once the only strong program without interference was in French. I must of sat there for 10 mts trying to imagine what the heck all the fuss was about, my schoolboy French is vewwwy rusty :)

Hi Jim

It's a jungle out there. Some nights I just don't know what to listen to - good jazz from the local community radio stations, international SW broadcasts from the BBC, Radio Netherlands, or even sometimes the VOA (if I need a dose of US propaganda). Then there's the scanner and the local scene. So many transmissions, so little time.

If you want to find the good international shortwave stations and frequencies, download a copy of the ILG radio database from http://www.ilgradio.com/ilgradio.htm#SW and the program to run it from http://www.ilgradio.com/gnpdb/gnpdb.html. All free, and very useful stuff.

The 8528 makes a great shortwave receiver, even better than my Kenwood R-1000 or the Sangean 909.

Thanks for the updated list. I also have an 8528 with the old frequencies and will update to the new list. However, I have detected what I think are a couple of errors.

1> Channel 83 lists Radtel channel 17 as 11662. I think it should be 14662.
2> Channel 86 (Radtel 20) should be 12211.5 instead of 12211.

Frank
If you download the 8528 zip file from my site
http://ozradio.wireless.org.au/8528.htm
the included pdf file has the most common freqs used these days listed

I wasnt aware you could program in freqs below 2mhz
Unless you have the 'special' software.....

Not sure how the PA will handle it.

From: kjobling@primus.com.au
Topic: 1204 Message: 1208

The "special" software that I am using is a program that I am writing (still under development) which creates the xxxxxxxx.28 file used by the 651PCFIL.EXE programmer from a text file containing the channel numbers, frequencies and options. The same result could be achieved by using a HEX editor on that file - carefully of course. The xxxxxxxx.GL3 file is not changed. Currently there is no checking for valid frequencies but this will be added - at least as a warning.

Ken - VK3KJC

PS: I still need the function of some of the bytes in the 27 character record for each entry of the .28 file and the format of the >GL3 file.

Ken,

Also tried rewinding an old CB whip to add extra L to an 8551 auto tune.
Tuned OK but I had to use pretty fine wire and hence was pretty inefficient.
I think a proper loading coil and the usual whip top would be better.

Thanks Ron,

Although I do not have the TXE option, I can program eproms with the 160M frequencies, and currently have the 160M band programmed in 1khz steps which should give a fair coverage. I will give it a try when I get an antenna organised.

1215. That B word [Off Topic...well and truly]

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-01-20 00:04:41 UTC
From: Jim
Topic: 1215 Message: 1215

Hi all. Well it had to happen. In the course of my travels I've come across some of the oppositions radios. You know, the ones that start with B. As a Codan man :) I'll be unloading them as soon as I can.....of course. But first I have to pop some decent frequencies into them etc.
And here's where I have to admit not having much of a clue about them. Numbers like 250Rc and 660 spring to mind.
If there's a clandestine whiz on the B word lurking on the list (shame on you...until now of course:)that has a minute to answer a question or 3, I'd love to hear from you offline at jimshire@...
Cheers
Jim

1216. AU Falcon Wagon HF Mount

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-01-21 10:48:00 UTC
From: Peter Mair <peter@nor.com.au>
Topic: 1216 Message: 1216

Last year, some discussed my problem on this group re installing a 9323 and mounting s 9350 on a Ford AU station wagon along with existing VHF/UHF radios and GSM/CDMA and Globarstar phones.

Sam P - Help ... did you ever take any dig. photo's or sketch the solution your company uses ... and please email these direct to me or upload to the files area of this group ...

Thanks

1217. Codan Lunchbox 6924 SSB HF Transceiver

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-01-22 00:52:39 UTC
From: harryhodkinson <hjh@technet2000.com.au>
Topic: 1217 Message: 1217

I recently acquired one of these, primarily for use as an item of 4WD safety gear, but it would also be useful to be able to chat and keep in touch with nearby (200km) people once a day.

Can anyone please advise: How useful would the 6924 be in an emergency situation? What is the 6924's output power and likely range? What network if any should I join to use it while touring within Australia?

Can anyone please help source the following items?: To get this working 6924 in better shape, I need a handbook, circuit diagram, etc., several (RFDS?) crystals & their plug-in circuit boards.

My kind regards, Harry

Not familiar with the radio, but wrt networks and the like, I can give some advice. VKS737 is a good network to have as a safety net as they keep an eye on you with regular skeds, however they are not cheap (66 or 77 dollars per year), they have only 5 channels, and they actively discourage having a chat with other members on their freqs which kind of kills of your chat with mates concept. There are other networks (often a loose collection of friends) which are much smaller that have more freqs, much much less people to tie up the freqs, are cheaper, and they are more than happy with you chatting on the channels with your mates. The only possible drawback is that you can only chat with other members - i.e. if you and your mate both have to be members of the same network to have a chat on that networks freqs. The RFDS licence is the cheapest at around $30 per year, but there are some restrictions on where and when you can chat.

Couple of other points. The networks and phone services are all after more members($$) so I guess there's a fair bit of politics involved. Decide what you want from a network, ask its members how well they provide the services you want then look at the $ factor.
Personally I've never been hassled on 737 for having a quick chat. Of course you have to pick your time and place. But with so many people using the network at prime times I wouldnt want to be discussing Aunt Mabels health during sked times, or during an emergency :) I'd love to see 737 with a galah channel and a data channel or two. Would be nice to press a button and know that someone had my GPS coordinates. I suspect that it might save search and rescue costs also.
Horses for courses I guess. The great thing is that we all have a choice of networks.
Cheers

Yep agree totally Jim - I joined a group which is capped at 100 members and we have 9 freqs for use (between 3 and 15 MHz). There is a reasonable bit of activity, but you can always find an unused freq to chat on, and there is none of the excessive crowding and over organisation involved with 737 network. I guess I come across as a critic of the 737 network, and whilst I do have issues with them, I am also a member of them - makes for a bit of money spent on radio licenses - annually my licence and membership fees are a bit over $200 (amateur licence, RFDS licence,737 and another groups membership), but overall I feel it is worth it.

I've got a Codan 6924 lunchbox for sale at
http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&category=3308&item=3002905014&rd=1
Yes I know you've just fallen over at the buy price but the last one I saw went for more and didn't even have any useable channels in it.
Oh, I've also decided that as a Codan man I'd have to offload the radios from the opposition (the B word). Naturally since you guys arent the slightest bit interested I won't give the urls out here :))
I'm only selling because there are too many radios around here (and I've been found studying maps of the Canning Stock Route...and we all know what THAT means...)
Cheers

1225. -Continuing saga with 8558 A/tune

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-01-24 08:45:25 UTC
From: C Huxley
Topic: 1222 Message: 1225

Well today I decided to finally try and isolate why my 8558 autotune mysteriously decided to stop working on the 8528. Basically it stopped working after we got into Yulara from a Simpson crossing....I had just washed the worst of the dirt off the car so I could see what colour the car was!!

So following the instructions from Ben and Jim I made sure the radio was fine....4 transistors are cool to touch so I assume the AD board is OK. Quite anxiously I decided to follow the web page instruction and disassemble the autotune.....give me an engine not electrics any day.

Anyway it came apart easily enough the one unsoldering item was enough to test my soldering skills, but alas (or is it good) I could see nothing wrong with the internals. It is a D series but strangely has the clear tubing but the later style internals....does it matter?

Everything seemed in order, all the screws were tight, there was evidence of it being repaired at some time in the past, as the brass bolts had been undone and the yellow tape was undone. I gave it a clean anyway and reassemble fitted it to the vehicle and still get TUNE FAIL.....any freq I try.

I assumed at this point the only other thing could be the control cable and after removing it, I found a small hole through the outer shield and water inside.

Now the question what can I do to fault find the cable?
Is their cabling I can substitute and use the factory connectors?
I could shorten the cable at the hole as the a/tune is rear mounted on the wheel carrier and the main radio unit is also mounted in the back of the cruiser.....should I do this?

Suggestions are welcomed.

Cheers

Craig

Topic: 1222 Message: 1226

Craig does the motor make sounds of tuning ? If so you might put an swr meter inline and check to see if the swr is varying as it tries to tune. If it is, then cable probably ok and I'd suspect the electronics in the aerial. Those plugs cab be sneeky lil dudes. If it tries to tune and can't, and the swr isnt changing, then its possibly something mechanical in the aerial. When putting back together you did check continuity between the ends of the coil and the rf lead ?
If you can't find an swr meter hit me offline and I'll organise one for you.
The plug at the aerial may be suspect if its been twisted or damaged. Take it apart carefully and look for shorting strands of wire etc. Check cable with a multimeter before disassembly. Refer to Bens webpage.
I don't have a spare cable unfortunately, but I'm pretty sure that your mates at the big C to the west would know where one is. . Mind you they aren't cheap, worth trying to repair/shorten as a last resort.
Cheers
Jim

Topic: 1222 Message: 1228

Jim,

Working in the AM unfortunately. Stuart or Geoff will have an SWR to borrow as well. The motor is definitely doing the tune thing.

Unfortunately you got rid of your 8558 didn't you? Otherwise I could just plug mine into your set and see how it went.....not to worry. I will try the multimeter, just need something small enough to get into the antennae plug.

As I said the lead is showing signs of damage about 4 feet from the autotune, I'm tempted to peel away the casing and have a look at it...what do you think? I guess with hindsight the fact it stopped working when I hit the car with water made me think it was something to do with water in the electrics...I thought it may have been in the actual a/tune but there are absolutely no signs of water or dust entry into it.

Cheers

Craig

| bolts had been undone and the yellow tape was undone. I gave it a
clean
| anyway and reassemble fitted it to the vehicle and still get TUNE
| FAIL.....any freq I try.
|
| I assumed at this point the only other thing could be the control
cable
| and after removing it, I found a small hole through the outer shield
and
| water inside.
|
| Now the question what can I do to fault find the cable?
| Is their cabling I can substitute and use the factory connectors?
| I could shorten the cable at the hole as the a/tune is rear mounted
on
| the wheel carrier and the main radio unit is also mounted in the
back of
| the cruiser......should I do this?
|
| Suggestions are welcomed.
|
| Cheers
|
| Craig

Topic: 1222 Message: 1229

No worries Craig. I did sell my 8558, otherwise it would be a breeze. You've little to lose by checking it with a multimeter first, and if sus then opening the lead up carefully at that spot. By the way I found a crook plug on my "new" autotune. Luckily it was easy to short term fix until I can get round to replacing it. Don't feel alone :)

Subject: RE: [codan_outback_radio] -Continuing saga with 8558 A/tune

Jim,

Working in the AM unfortunately. Stuart or Geoff will have an SWR to borrow as well. The motor is definitely doing the tune thing.

Unfortunately you got rid of your 8558 didn't you? Otherwise I could just plug mine into your set and see how it went.....not to worry. I will try the multimeter, just need something small enough to get into the antennae plug.

As I said the lead is showing signs of damage about 4 feet from the autotune, I'm tempted to peel away the casing and have a look at it...what do you think? I guess with hindsight the fact it stopped working when I hit the car with water made me think it was something to do with water in the electrics...I thought it may have been in the actual a/tune but there are absolutely no signs of water or dust entry into it.

Cheers

Craig

| Subject: [codan_outback_radio] -Continuing saga with 8558 A/tune
|
|
|
| Well today I decided to finally try and isolate why my 8558 autotune
| mysteriously decided to stop working on the 8528. Basically it
stopped
| working after we got into Yulara from a Simpson crossing....I had
just
| washed the worst of the dirt off the car so I could see what colour
the
| car was!!
|
| So following the instructions from Ben and Jim I made sure the radio
was
| fine....4 transistors are cool to touch so I assume the AD board is
OK.
| Quite anxiously I decided to follow the web page instruction and
| disassemble the autotune.....give me an engine not electrics any
day.
|
| Anyway it came apart easily enough the one unsoldering item was
enough
| to test my soldering skills, but alas (or is it good) I could see
| nothing wrong with the internals. It is a D series but strangely
has
| the clear tubing but the later style internals....does it matter?
|
| Everything seemed in order, all the screws were tight, there was
| evidence of it being repaired at some time in the past, as the brass
| bolts had been undone and the yellow tape was undone. I gave it a
clean
| anyway and reassemble fitted it to the vehicle and still get TUNE
| FAIL.....any freq I try.
|
| I assumed at this point the only other thing could be the control
cable
| and after removing it, I found a small hole through the outer shield
and
| water inside.
|
| Now the question what can I do to fault find the cable?
| Is their cabling I can substitute and use the factory connectors?
| I could shorten the cable at the hole as the a/tune is rear mounted
on
| the wheel carrier and the main radio unit is also mounted in the

Hi Alex, it was a bit tongue in cheek. I'd have to be pretty badly off to even consider it seriously. I believe in a fair deal for a fair price. Sure the business has to make a dollar, but they don't have to rip everybody off to do so.
Oh and by the way, saw a Codan 8558 series A? cable and plug this morning, still in its wrapper. Its the one with the big plug and pins. Very educational.
Cheers
Jim

Someone might be throwing an old Moonraker AT230 at me. Yeah, I know, Jim the Junkman . As I understand it these pre date the Codan 8551 by a goodly bit. The general feeling appears to be, put it in a museum. Since nobody has thrown it yet, can anyone confirm that these are fairly useless these days ...or is the at230 a later one that has some value ?
Cheers

Point taken Jim, although I have to admit I've found many "treasures" there myself... I wouldn't have my fire fighting pump if I hadn't stumbled across one at the Civic store before it closed.. Lucky they had no idea what it was (of what it was worth).

Ah, The old series A.. Yes, I 've got one of those somewhere in the junk box... They became kinda useless after the factory mod to the Amphenol connector... (those Amphenol mod plugs are $68 now).

Keep cool in the heat.

Thanks Alex. Have to admit I bought a couple of cheap spotlights there for a trip. I thought ah well they'll disintegrate like the rest have. (quite a few well known brands dont survive our tracks) They didnt. I saw the lights on the web, they are about $300 each with a lifetime guarentee and I bought em for $20 a pair. Like your pump, occasionally you can score a bargain.
Hope the fires stay away from you and yours.

hi
having trouble with 8558 and 8551 not tuning to 8022meg tune all
other vks freqencies ok. motor drives ok have a toyota surf with
aerial on rear wheel carrier with earth braid to body.
recently had found problems with a couple of coaxs and have changed
these along with the 8551. (the 8551 I changed is probably ok as the
faulty coaxs stopped any tuning whatsoever)

previously this set up worked ok.

Hi. If you haven't already, check out Bens web page on 8558's. Something has obviously changed. A lot of selcalls on 8022 ? Clean the coil and contacts. Does it tune at low frequencies or did you just try it on 11 and 14 meg ? No low freq might indicate earthing. Dont forget you could try the link inside the base of the aerial.
Cheers

Bruce,
what sort of whip are you using?
fibreglass or stainless steel.
Try using it without the spring if fitted.
If using a fibreglass whip check the continuity from tip to base.
Some newer type fibreglass whips werent actually joined to the tip, you
can tell these ones, they rattle when you shake them. Not much you can
do to test them apart from swapping with a known good one.
Even Codan conceed the fibreglass whips have a limited life.

try extending the whip with 20cm of wire. This will change the point
inside the tuning coils needed for that freq. That will tell if the
antenna needs the insides serviced. It would probably be a good idea to
service it anyway, in case something is starting to work its way loose
or crack etc. Trying to constantly tune a physically damaged antenna
will make it worse.

Open up the control cable connector at the antenna end. (they unscrew)
make sure no wires are missing. I've seen weird things happen there.

1241. RE: [codan_outback_radio] AU Falcon Wagon HF Mount

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-01-28 03:51:46 UTC
From: Brian Lea
Topic: 1216 Message: 1241

Peter,

I remember the conversation last year, however it wasn't me involved. However I bought a bike rack for the landcruiser the other day, but because the cruiser also has fold down doors I needed something where I could open the door while I had a bike rack blocking the doors. What I ended up getting was one of those bike racks where there is a bar that sits over the ball and the actual rack folds down on a sort of hinge on the bar. This could also work for you, except that instead of having a bike rack that folds down on top of the bar, you could manufacture something so that a Codan mount that folds down instead. I have taken some photos of the bike rack, but not having the luxury of a digital camera yet (still slowly pushing the wife there for funds), I'll have to wait till I get the film processed before I can post them. You probably have a reasonable idea what I'm talking about though and might like to go to the local auto store, or bike store to see what they have on their shelves to get an idea of what you want.

Brian.

Ben,

How does one disassemble the a/tune en plug? It seems pretty firm and
didn't want to get too heavy handed.

I have high resistance on two wires in the cable and think I may have
some form of damage to the lead and want to make a new one up (actually
get someone better with a soldering iron to really)

Cheers

Craig

Jim

I've just returned from holidays. Thanks for your advice re possible radio networks for 4WDing.
That Codan 6924 price is OK. Will arrange to visit you and discuss this and other 4WD stuff further.

Harry

I've got a Codan 6924 lunchbox for sale at
http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&category=3308&item=3002905014&rd=1
Yes I know you've just fallen over at the buy price but the last one I saw went for more and didn't even have any useable channels in it.
Oh, I've also decided that as a Codan man I'd have to offload the radios from the opposition (the B word). Naturally since you guys arent the slightest bit interested I won't give the urls out here :))
I'm only selling because there are too many radios around here (and I've been found studying maps of the Canning Stock Route...and we all know what THAT means...)
Cheers
Jim

Matt

I've just returned from holidays.
Thanks for your advice re possible alternative radio networks for 4WDing including costs, scope for chatting, etc.
First, I'll have to decide which network to use, then set up the crystal channels OR opt for a more flexible transceiver.

Harry

Not familiar with the radio, but wrt networks and the like, I can give some advice. VKS737 is a good network to have as a safety net as they keep an eye on you with regular skeds, however they are not cheap (66 or 77 dollars per year), they have only 5 channels, and they actively discourage having a chat with other members on their freqs which kind of kills of your chat with mates concept. There are other networks (often a loose collection of friends) which are much smaller that have more freqs, much much less people to tie up the freqs, are cheaper, and they are more than happy with you chatting on the channels with your mates. The only possible drawback is that you can only chat with other members - i.e. if you and your mate both have to be members of the same network to have a chat on that networks freqs. The RFDS licence is the cheapest at around $30 per year, but there are some restrictions on where and when you can chat.

Subject: [codan_outback_radio] Codan Lunchbox 6924 SSB HF Transceiver

I recently acquired one of these, primarily for use as an item of
4WD safety gear, but it would also be useful to be able to chat and
keep in touch with nearby (200km) people once a day.

Can anyone please advise: How useful would the 6924 be in an
emergency situation? What is the 6924's output power and likely
range? What network if any should I join to use it while touring
within Australia?

Can anyone please help source the following items?: To get this working 6924 in better shape, I need a handbook, circuit diagram, etc., several (RFDS?) crystals & their plug-in circuit boards.

My kind regards, Harry

1246. antenna plug

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-01-28 21:35:05 UTC
From: ben
Topic: 1246 Message: 1246

Craig
from memory....(on holidays at the moment)

undo the two screws that hold the cable clamp arrangement
put the plug into the antenna to hold it. the back half of the plug
should unscrew.
Slide the metal bits of the plug back. Now you should just have the
plastic part with the pins in it, and the rubber sheath.
This is the yucky bit. All the wires go through individual holes and it
is tricky to solder back up as the wires cant be very long as the plug
wont go back together properly.

When you get it apart you will see what I mean

Ben

Thanks Ben.

Any suggestions on replacement donor cable? Standard printer cable type
stuff OK or is there some form of weather proof stuff I need.

Also I noticed another email about autotune problems and wonder if my
coax style whip is stuffed and should try a S/steel version....just buy
one?

Cheers

Craig

1251. Hams

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-01-29 10:38:56 UTC
From: Jim
Topic: 1251 Message: 1251

It goes without saying that we look in awe at those currently fighting bushfires. Fire personell, police , ambulance,SES, helicopter guys etc are all on our TV's and we look on em and say thanks guys. But there's another little known group who are perhaps a bit a bit closer to us.
People involved in Radcomms for a living often deride "Hams" as fiddlers (and worse). We've all had to fix some "experts" radio or mistake. They are, after all, hobbyists and we tend to look down our noses a bit on their hobby activities. Hams are often seen as relics of a bygone era.
Currently some 40 of these "fiddlers" are involved with providing or interfacing with communications involved with the Victorian bushfires through their WICEN organization. Their work has been applauded by the police, firefighting authorities, SES and the Red Cross. Victorian WICEN has activated a statewide HF network at the request of the police. Many more hams will see service doing everything from making coffee to using their or an emergency organisations comms in this time of bushfire crisis.

So to all the "fiddlers" out there, a big thank you.

Cheers
Jim , fiddler, ham and former WICEN co ordinator

Thanks Brian for your reply

Sam has emailed several pics of the towbar bracket his 'firm' uses and I think these will be good enough for my local steel fabricator to model upon. Thanks Sam !

A dumb question - concerning a 9350. I gather the spring should be level with the roof line (or the nearest flat metal surface). For a Rodeo style vehicle with a fibreglass canopy and a rear mount antenna - the groundplane is obviously the tray .. but I'm looking at a AU Ford Station Wagon install with a towbar mount - so should the base of the 9350 or just the spring mount need to be at roof level. I'm remembering my ancient history with Wagner radios and when McLeod HF whips had a yellow band to align with the nearest flat metal surface ie bonnet or boot level.

... now where to put the 9323 Control Head .. and will my XYL be happy riding in the rear seat !

Peter

Peter, would those pix sound like they could be useful on the list photos folder. I seem to remember a bit of interest in rear mounting of autotunes.
The 9323 head isnt a problem mounting. If its not going crashing and bashing even a bit of double sided velcro could hold it....maybe :))

Point taken Alex.
The bit about fixing radios was merely to point out that amateur radio often suffers a perception problem from professional radcomms people. Of course many of these are hams and probably got into their positions as a result of their hobby interest. I didn't mean to imply that all amateurs are unable to fix radios :)
To keep on topic, I'd have to point out that (before I get a hey stick to the topic rocket:). many amateurs use or own Codan radios as evidenced by the request for option A . Hows that ? heheh

Jim

I've got so much velcro around the centre console that you are likely to get attached to the vehicle !! I was involved with an ACA Inspector about 2 years ago (a good guy) and he had a frame that fitted over the front passengers seat and down into the footwell to hold various things like receivers and a very nice spec analyser. The front compartment of my Ford is getting like that !

When I get my bracket installed, I'll happily upload my pics to the folder.

Peter

G'Day Mal,

The 9323 with 9350 auto tune I presume, Here in the West the VKS network regularly hold get togethers generally for a long weekend in the bush for the members to attend and meet, and learn to use their HF's to their full benefit, I suggest contacting the closest Base.....use the HF send them a selcall and explain what you need, you may find you have some members close by where you live that can give you some hands on lessons.

I learnt thru reading the book and just using the set along with assistance from friends and fellow VKS members.

Cheers
Mick [West Aussie]
W809 S/C 1465
Codan 9323 & 9350

I do the adelaide sked for vks737 tuesday night 6.30 - 7.00p (7.p -
7.30p victorian) on channel 2 that 8022meg and im new to this as
well so give me a call i'll listen out for you.. also between 7p -
7.30p (SA) on channel 1 (5455meg)
I often get callers from vic doing radio checks

if you want to try earlier i'm sure any operator will oblige just
pick a sked and listen in youll soon get the gist of it

Just remember that although there are protocols, they aren't written in stone, especially for beginners. The base operators will put you at ease, especially if you don't do your first call during a busy time. We were all beginners once (write down your callsign and the base station on a piece of paper...I forgot both on my first time and I'm an experienced radio user !)
Cheers
Jim

Jim,
Thanks for your reply & when I get to know how to drive this thing
you will be my first call. I'm going for some lessons this saturday
(8/02/03) hopefully will give you a call early next week.

Hi Mike. The 25B may work with an 8558 if you can find an AD board. The later series of 25B's did. Not sure about using with the 9350. An 8528 will go ok but although the 25B is similar I suspect not.
Cheers
Jim

Mike , I am reliably informed that all you need for an 8525B (assuming the AD board has been pulled out) to
drive a 9350 is the 08-05727-001 adaptor cable.
I was wrong, again :)))
Cheers
Jim

Coming shortly to an ebay near you:) 8525B local, 8528 local, 8551/58 autotune, MORE ripper 6924's(with only 3 *sob* channels in em), and a few Codan power supplies. Oh and maybe a couple of option AD boards. Forget what I said about boat anchors, this is GOOD stuff. (Even though it hasnt arrived yet I can tell because its costing a fortune:)).

Cheers
Jim

You do not have to have a RFDS licence to operate on the VKS737 or radtel networks - you are considered to be licenced to operate on their networks if you are a member of them. However if you want to operate on the RFDS freqs, I am pretty certain that you need a RFDS licence - and yes you are right, it can be a bit on the confusing side of things. I have maintained my RFDS licence, but have also taken out membership in VKS737 (must remember to renew it pretty quickly), and another 4wd network.

I think you will find that in any genuine emergency no emergency service will be upset, unless that is you interfered with existing emergency communications on that freq.

AFAIK All state police freqs are the same although some states may have more licenced freqs than others.

In Qld we have a section in our Criminal Code (which overrides all subordinate legislation) which is an exculpatory provision entitles "Emergency". Basically do anything bar kill or do GBH in an emergency if a reasonable person would do the same.

Comms being Fed controlled is different however in the absence of similar provision the State legislation applies.

Cheers

Craig

1287. Codan NGT AR Question

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-02-14 00:01:15 UTC
From: Mal Haxton <MalHaxton@warrenandbrown.com
Topic: 1287 Message: 1287

Hi,
In the manual that came with my radio (Codan NGT AR) it mentions making an emergency call using the emergency key (the main reason for purchasing was in case of emergencies), it says to test your transceivers emergency call facility on a regular basis. Who would/should I call when doing this, I'm a member of the VKS737 network. Thanks

1288. Re: [codan_outback_radio] Codan NGT AR Question

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-02-14 00:15:54 UTC
From: Ben Hobson
Topic: 1287 Message: 1288

Mal

The emergency button is the RFDS emergency call and as such will only work on those frequencies. It is a two tone system designed to alert a RFDS base in the absence of an operator. If the base is attended they will respond by voice immediately, if unattended the base will respond with a revertive tone to acknowledge. Then the base will contact an operator using another system (pager etc.) to get an operator to speak to you ASAP.

If you have an RFDS outpost licence you could call up a base on voice and notify them you intend to carry out an emergency call button test before pressing it.

You need to hold in the button for approx. 2 seconds to activate it and can be cancelled mid stream by pressing the PTT (well you could on the 8525/8528).
I am under the impression it is still an offence to test such a function without first notifying the RFDS.

In summary, the Emergency call button is unique to Australia and only works on RFDS channels. As far as emergency calls with the VKS or any other network, contact them and obtain their procedures.

cheers
Ben

Of course an alternative is to call a nrtwork base (not at a sked time) and pose the same problem. I'm sure you're not the first to ask. Even a phone call to their office may do it. One would suspect that with an instruction such as that ie test it often , that the tranceiver might have an internal testing facility ie decoder, I'd look for this in the manual. This is an unlikely scenario and I'm not familiar with the NGT. But its a start.
Cheers
Jim

1295. Magnetic loop antennas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-02-19 07:07:23 UTC
From: harryhodkinson <hjh@technet2000.com.au>
Topic: 1295 Message: 1295

I see that one manufacturer supplies a "magnetic loop antenna" built into a 4WD roofrack and claims it to be far superior in output to a conventional whip antenna. How do these antennas work in principle? Is it possible for an amateur to construct his own?

Regards, Harry

1296. Re: [codan_outback_radio] Magnetic loop antennas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-02-19 07:40:23 UTC
From: Jim
Topic: 1295 Message: 1296

Hi Harry, I havent seen that one, but I'd guess its just a tuned loop, probably using some matching device. The first thing I thought of is what happens if you put metal eg Jerry Can or wheel on the rack ? Tuning changes ? I mean one can load up the bullbar using a gamma match but an effective radiator ? I doubt it. Especially at low radiation angles.
Think I'll stick to a whip. They don't usually go too far wrong.
Cheers
Jim

Hi all, the antenna being referenced is the "QMAC " MR-90 (I think.) antenna. Comes complete with a roof rack for your vehicle. It uses an antenna tunner mounted on the bottom of the rack to tune the loop, the roof rack is just used as a counterpoise groundplane.

Refer to www.qmac.com.au for all the details and downloadable PDF file. The antenna is designed for low angle transmission, 1000 klm and is supposed to be better than a vertical mobile whip (10db better apparently!) for shorter range comms.

I was actually talking to their head office today for work thats how I know about it, they want us to try one but I think the Brolgas and "Wedgies" up here would destroy it if they hit the antenna on amoving vehicle, S/S whip tops are easier and cheaper to replace.

BTW the new replacement whip top for the Codan 9350 definately works down below 2020 and is actually made by "Antenna Specialists" in the USA with the ferule made and fitted here. We received some still in the original packing with labels saying " 80" S/S whip top only" and the part number. Only the bottom opened so the ferules could be fitted.

Regards,
Sam Point

Hi Sam. Yep, had a peek at it. Of course any radiator that transmits straight up instead of at an angle is going to be better for short range ...but why not just bend a Codan whip over and tie it to the rack? That contraption looks like it's not designed for tree branches and I still rekkon a roof rack would have detuning elements thrown up there :))
The whip tops are interesting. I have a couple of local ss whips coming that I am going to try out, I'll report on any progress.

Hi Jim, my feelings exactly re the roof rack.
In regards to the new S/S whip, we have a few running around the
Gulf and Birdsville way and they seem to not bend (Permanently Deform!)
as the original Codan ones do. Not sure on survival after 60,000k's on
corrugations but time will tell. The one on my truck is going ok but not
much travel over Christmas, it does go through low hanging trees and
servo roofs better though :-)

Regards,
Sam

Know what you mean, we have one bloke who is banned from taking his work vehicle into one particular servo out West. He drove in one night smashed a couple, reversed at an angle smashed a couple more then got the sh_ts and drove lengthways out the side of the pump area smashing all the tubes on the side. He did have the Black whip on though and now only uses the S/S whip as he has broken 2 of those by going onto the side of the road under signs!

Anyway, there are frequencies around 2020 used by pastoral stations up here that are occaisionally used by our guys during mustering to talk to the muster bosses until they get in range of the UHF CB radios used by the ringers and the old S/S whip couldn't cut it.

1304. 9323 microphone question

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-02-22 12:04:07 UTC
From: ajbalm <balm@pipeline.com.au>
Topic: 1304 Message: 1304

Has anyone had a 9323 microphone that for some unknown reason intermittently does not work any of the remote features on it eg volume, channel change etc. The PTT works fine, only the remote features dont work some of the time.

I plugged another mic into the remote head & have no probelms - so if figure it is probably an intermittent fault in the microphone. Tested all the wires in the curly cord - all ok, no shorts or opens regardless of how much stretching or bending I do to the cord.

Any ideas of where to look or what the fault may be???????

Tony

1305. Antenna mount on cab chassis

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-02-23 12:25:31 UTC
From: lowlines <lowlines@tpgi.com.au>
Topic: 1305 Message: 1305

Hi all,

Wazza here (been lurking for a bit). I am hoping to not have to reinvent the wheel!! Has anyone had any experience mounting an auto tune antenna on the back of an aluminium tray?

I have a GU patrol (see photos in Wazzas truck) and need to mount the antenna behind the cabin. Bullbar mount is not an option. I am about to pick up a Heaslip traytop camper and believe that I have approx six inches gap between the camper and the tray. I have been told to mount the antenna as high as possible in order to clear the metal body of the camper (camper will be no higher than the roof of the cabin as a tent folds out from the top of the camper.....reduces wind load and clearance).

The difficulty is fabricating a suitable mount to hold a rather heavy beast!!! Has anyone done this already or has an alternate mounting idea?

Any input appreciated.
Wazza

From: Ben
Topic: 1305 Message: 1306

Wazza
just for your info..
Only about the top half to third of the antenna base needs to be above the groundplane, in this case the roof.
I would suggest making a bracket that can fold down in case you need to drive under a low roof somewhere. Perhaps able to fold itself if you forget and hit a tree branch or something?

The tray/camper combo doesnt by any chance have the spare wheel mounted on the very back of the tray does it? Brackets are available ready made that would suit that location.

cheers
Ben

Thanks Ben,

I was thinking about some sort of folding bracket, I will have a chat to the engineering mob this week to see what they can suggest. Unfortunately the camper has nothing at the back at all, the tent folds out over the rear of the camper so there needs to be clearance. Looks like the back of the cab is the go!!

Thanks for the info
Cheers
Wazza

Wazza,

I'd be inclined to wait till the camper is on the back and then evaluate where to put the antenna. I have seen the HF antenna mounted behind the cab up high on a GU Ute, but this was on the double across OZ record run, and it was mounted on top (or just to the inside) of a roll bar. All the other HF antennas I have seen behind the cab have basically been in the same position (up high on a roll bar).

Brian.

Brian,

Waiting is my first preference however time is starting to get away from me!!
(still might have to do just that). The bar across the back of my cab is not strong enough to mount anything so I think I will have to try to prefab something that will originate from the mounting plates for the tray.

Cheers
Wazza

I am after info on RDD providers to use with the Codan 9323.

I can only find Radtel & Pentacomstat on the net, I'm sure there must be others out there.

Are there any that provide just a fee for use or are they all based on a 12 month subscription even though you might only need it for 2 months?

Any info/ experiences greatly appreciated.

Tony,
I am a regular user of Radiodata. $115 per year plus call
charges.
I have found them to have good reliable coverage.
As a 'bushphone+' user you also get access to their 'bushtelegraph'
frequencies which I find useful for car to car comms....especially
when my mates are on trips & I'm not (& vice versa)

They have a very basic website at www.reidsradiodata.com.au.

No affiliations etc...

Regards,
Rick Hunter

Hello,

I am new to the world of HF radio. We are heading off on the "Grand Trek" later this year and we are currentluy preparing.

I have purchased a Codan NGT AR.

I will be installing it in a Land Cruiser 100 Series. I have read many comments on the Group about how and where to instal - Aerial and DC cables on separate sides etc. I am interested in recommendations of companies/people who can do a professional instal job.

I am also keen to invest the time in learning what I need to know to make the best use of the NGT. Does anyone know of people or organisations who provide training?

Last but not least, research to date says that VKS737 is the way to go. Any comments or alternative suggestions?

Thanks in anticipation

Hi. Can't help with the NGT I'm afraid but I'm sure others here can. Installation and training will be a matter of location I guess. I'm surprised your supplier didn't offer these services. Its also a function of exactly what you want from your radio.
Re 737, yes they are good but not the only network. Take a peek at Bush Telegraph services, they are cheaper in the phone dpt. Quite a few here have membership to both services.
Having been "grand trekking" a couple of times myself I know you'll have a ball. Just don't be like one couple I know who went 7 years beforehand and "kinda forgot to come back" :))
Cheers
Jim

Subject: [codan_outback_radio] Codan NGT AR installation and training

Hello,

I am new to the world of HF radio. We are heading off on the "Grand Trek" later this year and we are currentluy preparing.

I have purchased a Codan NGT AR.

I will be installing it in a Land Cruiser 100 Series. I have read many comments on the Group about how and where to instal - Aerial and DC cables on separate sides etc. I am interested in recommendations of companies/people who can do a professional instal job.

I am also keen to invest the time in learning what I need to know to make the best use of the NGT. Does anyone know of people or organisations who provide training?

Last but not least, research to date says that VKS737 is the way to go. Any comments or alternative suggestions?

Thanks in anticipation

Thanks Jim,

I should have mentioned I am based in Melbourne.

As to installation services from supplier, I purchased the radio from someone who was going to do the trek, but as happens with great plans sometimes, it didn't work out that way.

Cheers

Peter,
depending where you are in Melbourne / Victoria there is another alternative.
Peter James runs a business called Lara Electronics located in Lara - between Geelong & Melbourne.
Ph 0418 599355,
email pjames@...

Peter has a number of Codan Dealer Sales awards - must be doing something right by someone.

PS I am not affiliated with him or his business - I'm an Ambo who is extreemly happy with his service.

I first came in contact with him when looking around for a HF radio, he was good enough to spend a hell of a lot of time with me AFTER HOURS (because of my shift roster) chatting about the various sets & features from the new NGT to as far back as I wanted to go. I ended up getting a SH 9323 & he even gave up time to explain how to drive some features I could not work out.

Now that is what I call service & am more than happy to go back to him for service & advice.

Another Victorian Company mentioned else where in discussions on this site was happy to tell me what I must have & were not prepared to discuss anything else & it all had to be in their time not mine or a compromise. Their adds were also way out of date & when I mentioned this to them I got an ear full.

Well I'm sure you can guess where I went.

Peter James is also a SERVICE AGENT for the Codan & other gear so you are not just dealing with a salesman keen to make a buck. HE installs, programs & repairs the equipment he sells as well as provides training to ensure you get the most out of the set.

On the subject of radio providers - I recently recieved some information via the good members on this site about Radiodata / Bushphone. If you contact them you may be pleasantly surprised to find their Bush Telegraph (radio service) is currently FREE to join. Their Bush Phone + service (RDD) is $115.00 PA with $1.00 connect & 50c / minute fee which is substantially cheaper than some others.

You need to do your home work & find out what service is best for YOU.

Email me off line if you want more info.

Cheers
Tony

1323. 8533 Question

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-03-19 23:40:24 UTC
From: ib_oz
Topic: 1323 Message: 1323

Hi all,

Recently acquired an 8528 with an 8533 remote control head. This head is different to the ones I've previously seen on 8528's. It has OTC call buttons and some of the buttons are labelled differently to the 8528 manual.

Any info on the 8533 head would be appreciated. Are the membranes better/available for the 8533?.

I've posted a picture at

http://photos.groups.yahoo.com/group/codan_outback_radio/vwp?.dir=/8533&.dnm=8533+Remote+Control+Head.jpg&.src=gr&.view=t&.hires=t

don't forget to cut and paste the URL.

ta,

Ian B

Hey Guys,

Use to have one of these little beauties. I had the 8528 with normal 8528 front panel, plus the 8533 control head as you have.

Basically all the buttons work the same as on a normal 8525, it is just the 'OTC' buttons that are different. A few years ago, Telstra Radphone (now defunct) used to be called OTC (Overseas Telecommunications). They had 'coast radio stations' which you could call to make radphone calls at: Adelaide, Brisbane, Darwin, Melbourne, Townsville, Perth, and Sydney. Each of these coast stations had their own selcall number. Eg. Melbourne was 0106, Sydney 0108 etc....

The OTC Selcall function simply chooses one of these numbers automatically and allows you to scroll through to pick the one you want. Try pressing the OTC Selcall button, then the 'Select Channel' button (several times) to choose the base you want.

The OTC tone call button actually does the same as the Emgcy Call button, with the exception that it does not 'latch on' after pressing for about 10 secs. Back in the dim dark ages, OTC set up the ability to respond to tone calls to alert the operator. It did not warrant a 'distress' as it did with the RFDS.

I will post a few pages out of the old operators manual for you to read. If you would like any other pages, let me know and I will try to post or email them as required.

Cheers and have fun with it, it's a great set.....wish I hadn't sold mine.

Mark

From: Gary
Topic: 1327 Message: 1327

Hi All,
I am trying to find out what the following frequencies are
used for.I can't find any info on them anywhere.They are :
2805
2792
3032
3372
4516
5688
5945
7593
8976
10496
11236
15677
All these frequencies are on some old Terlin Tapped whips I was
recently given.
Any help would be greatly appreciated.

Cheers
Gary

You can search freqs on the Aust Communications Authority Web Site.
ACA.COM.AU from memory.

You can even search on licencee's...so put in "your favourite government
department" and find out what freqs they own.

Cheers

Craig

From: Stefan Kossen
Topic: 1330 Message: 1330

Hi All,

I have a lot of questions in regards to HF radio's

We are going to do the CSR in 2004 from QLD, and would prefer to
have a HF radio with us.
I have no experience with HF at all.

Is there a good website where I can do a bit of reading?

Thanks in advance,

Stefan Kossen

Hi Jim & Brian,

OK Here goes, No laughing

When travelling from QLD to CSR, what would be the frequencies required?
Can you always reach the RFDS on the same freq, or do you need to change
from area to area?

Is the HF set always used in SSB?

Can it also be used as a 27Mhz CB?

Would a HAM/amateur radio work, and if so what range of frequencies
would be required?

What do the number on a Codan mean? Is it a code or just a series
number?

What would be a good set to start with?
And what should one expect to pay??

Thanks in advance.

Stefan.

Subject: RE: [codan_outback_radio] newbie to HF radio's

Hi Jim & Brian,

OK Here goes, No laughing

When travelling from QLD to CSR, what would be the frequencies required?
Can you always reach the RFDS on the same freq, or do you need to change
from area to area?

Is the HF set always used in SSB?

Can it also be used as a 27Mhz CB?

Would a HAM/amateur radio work, and if so what range of frequencies
would be required?

What do the number on a Codan mean? Is it a code or just a series
number?

What would be a good set to start with?
And what should one expect to pay??

Thanks in advance.

Stefan.

Hi Stefan. There are several sites which give quite a bit of info on HF.
If your questions are technical try
http://ozradio.wireless.org.au/codan.htm. For a more general view try my
site at http://www.jimshire.aussiewide.com/
Feel free to ask questions here or email me offline.
Cheers
Jim

Hi,
Has any one got or know where I can get two selcall boards or mics cheap for two 7727 remotes I have, I am fixing them up, one for a work mate & one for my son to use on the vks737 net.

Cheers
Wayne

G'Day Stefan,

Try the VKS-737 Website in SA. at http://www.vks737.on.net The VKS network is a very user friendly radio network that logs position, handles emergencies etc, passes messages too and from you to family and friends etc. it has a few thousand or so members and its only $77.00 per annum non club member.

Thanks TJL,
If I read this correctly than with these five frequencies
Channel 1 5455kHz
Channel 2 8022kHz
Channel 3 11612kHz
Channel 4 14977kHz
Channel 5 3995kHz

Through these base stations

. Adelaide (SA)
. Alice Springs (NT)
. Cairns (Qld)
. Charters Towers (Qld)
. Derby (WA)
. Darwin (NT)
. Newcastle (NSW)
. Perth (WA)
. Sandstone (WA)
. St Marys (Tas)

You should always be able to contact someone?

If so than all I need is a simple crystal? 5 chanel Radio?

Or am I way of here?

Stefan.

A simple 5 channel radio will suffice - with an antenna with the appropriate tap points. Having said that, having a selcall facility makes it a lot easier - with selcall you can call up the bases as usually (out of sched times) they will mute the radio so they do not have to listen to the static (in my experience anyway). I run a reasonably simple setup - a codan 8528 with an auto tune antenna - cost me $1700 a couple of years ago, and is worth every dollar. If it is your life that is at risk, then money spent to safeguard it is well spent - a brand new NGT is possibly overkill, but there are cheaper radios around that will do the job fine. My recomendation is for the setup I have - bit of a middle of the road type setup, but quite satisfactory.

Thanks Matt,

I think I read that the Codan 8528 has 50 + 99 channels?
How are these changed, Crysals, EEPROM Burner, or just a cable from PC to radio?

Are the Marine radio's any good?

You don't know any for sale :-)

Cheers,

Stefan

From: Jim
Topic: 1330 Message: 1339

It depends on what you want from your radio. A simple 5 channel xtal locked radio will provide the minimum of access to 1 network and possibly the RFDS. Should you require phone, GPS coordinates transmission or broadcast reception then you'll need a more modern setup. Selcall facilities and the RFDS alarm facility should be seen as minimum requirements. Autotunes are great but it's amazing how often you stay on one channel if on the move. When stopped it's a lot cheaper and in some cases reliable to get out and change the tap on the whip.

Hi all,

I have seen this posted before but I cannot remember what the details were.

Has anyone ordered a LSB crystal for an 8525/8 recently, I would be interested in knowing what company's can supply them and approx cost and delivery time?

I seem to recall HyQ were mentioned.

On this subject , I had a look at that site and you have to know what
your on about ...which I don't when it comes to crystals , so does
anyone know what the ordering specs are for crystals to put in a
7727C ?

Thanks .

> Is the HF set always used in SSB?
I'd say around 90% if not more of the time unless listening to commercial radio stations. Usually USB for marine, aircraft etc too I think. Some amateur bands use LSB but Codans and Barretts don't usually cover LSB.

>
> Can it also be used as a 27Mhz CB?
I think most Codan/Barrett stop at around 22-25Mhz ruling out cb.

>
>
> Would a HAM/amateur radio work, and if so what range of frequencies
> would be required?
Yes, I have an old amateur radio and it does cover 27mhz as well re your last question but, the downfall is no selcall.

>
> What do the number on a Codan mean? Is it a code or just a series
> number?
Sounds like model numbers.

>
> What would be a good set to start with?
> And what should one expect to pay??
$650 starting for 2nd hand semi-modern equipment up to around $3-4k (including antennas etc).

The 8528 has 99 + 500 channels. 99 are user programmable (RX only unless you can shake loose a copy of the EEPROM software) from the front panel - aka "P" channels, with the other 500 needing an EEPROM burner. Marine radios are pretty similar with largely cosmetic differences, they will still work on the same freqs.
I bought my 8528 from a bloke called Alex? who lives in Macedon in Victoria. He has made a little hobby out of picking up secondhand HF radios (particularly from mining companies), cleaning them up, servicing them, and then onward selling them for quite reasonable prices. Last time I conversed with him, he wasn't on the internet, but he was advertising each week in the trading post. I might still have his contact details around here somewhere, but I doubt it - however if I do find them, I will drop you a line with them.

Cheers

Matt

Thanks Matt,

I think I read that the Codan 8528 has 50 + 99 channels?
How are these changed, Crysals, EEPROM Burner, or just a cable from PC to radio?

Are the Marine radio's any good?

You don't know any for sale :-)

Cheers,

Stefan

A simple 5 channel radio will suffice - with an antenna with the appropriate tap points. Having said that, having a selcall facility makes it a lot easier - with selcall you can call up the bases as usually (out of sched times) they will mute the radio so they do not have to listen to the static (in my experience anyway). I run a reasonably simple setup - a codan 8528 with an auto tune antenna - cost me $1700 a couple of years ago, and is worth every dollar. If it is

your life that is at risk, then money spent to safeguard it is well spent - a brand new NGT is possibly overkill, but there are cheaper radios around that will do the job fine. My recomendation is for the setup I have - bit of a middle of the road type setup, but quite satisfactory.

Stefan
have a look at my site http://ozradio.wireless.org.au
Most of your questions are answered. The marine set, apart from having the buttons labelled differently, only major difference is AM on 2182 khz.
The radios use an EPROM, which holds 501 chans + 99 p channels (600 total)
You can program TX P channels by simply shorting two contacts inside the radio at switch on.

Give me a yell offline. I have a local 8528 with various options 4 sale.
I can program eproms for you with whatever you want. I can do CB frequencies however they are only USB/LSB, not AM.

cheers
Ben

old cheats method. firstly lower freqs will be at the bottom. high freqs
at the top.
plug the antenna in, select a channel. change taps until you get the
loudest mute noise. thats the best tap for that channel.
Failing that find a SWR meter..

cheers
Ben

Commercial activities usually use USB. Amateur bands below 10meg use LSB, above 10 meg its USB. This is a historical rather than technical thing . Most amateur equipment can switch sidebands whilst not all commercial rigs have the facility.

Matt, Jim and Ben

Thanks for your advice, I emailed Terlin and guess
what they sent me the freq chart :-)

The antenna is marked with a, b, c, e, ... not enough
room to write the freq's on I guess.

Anyway if anybody is now after this info, give me a
yell and I will send it too you.

Hi Stefan,

An old set like a Codan 7727 will do the job but you should have a Selcall mic plus you will need to have the right crystals fitted. This will allow you to make Selcalls & to Receive selcalls as well as to respond to selective bacon calls. It will not do 27 Mhz CB as they max out at around 15-18 Mhz depending on the model.
I am not up to date on later Codans.

Barrett 550s & later have selcall plus selective becon & will also do 27Mhz CB. I believe the latest Codans will also do 27Mhz but others in the group can tell you if that is so.

The VKS-737 network is very good & is the net I am on. My two old 7727's are in semi retirement till I can put selcall in them & I now run a Barrett 550 with autotune hence my lack of late Codan knowledge.

You can get tapped whips that you get out & change the tap on to change channels followed by slider whips where you get out & move the slider to set the channels. The tapped whips are limited to the channels that they have taps for where the sliders can be set to nay channel you have in your set. You should mark the slider with your channels & test with a swr meter before leaving so it is easy to set when needed.

Do take a spare whip or at lease a emergency antenna as the fitted one tends to break if the car rolls & that will be when you need it most.

Hope this helps.

Cheers
Wayne

1365. 9323 vs 8528

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-04-07 14:28:38 UTC
From: Paul Dudley
Topic: 1365 Message: 1365

Just a trivial thought,

what are the differences between the 8528 and the 9323 as far as the RF stages and the motherboard,micro etc. I seem to recall that the later 8528 manual has serial a serial interface for programming etc.

Is there any difference to the PA?

Regards

Paul

Hello to the group.

I have a 8551 and a 8558 and would like
to use them but with another hf radio than a Codan.
I heard about the 8552 unit. Has someone in this
group
this old unit to sell or any other solution?

Best 73.

Have a look on my site
http://ozradio.wireless.org.au/codan.htm

and download the 8558 manual in the antenna section.
It has all the info you need to run one of these antennas on a non codan
radio.
cheers
Ben

Paul
a fair bit actually.
The later model 8528 was called a 9313 or a 9480

9313 and 9480 - 15 channel radios, selcall capability. Transmit 2 to 24 mhz, Receive 250khz to 30Mhz. Both
transceivers will drive a 9350 or 8558 antenna. Option AD is required for the 8558. These radios appear to be a
rebadged 8528 with the ability to be programmed via PC instead of EPROM.

9313 available in remote control only.USB only.100 watts PEP. RFDS emergency call.
9480 available in local or remote control.USB & LSB. 125 watts PEP. CW capable

cheers
Ben

1370. Codan historical article

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-04-08 09:37:02 UTC
From: Matt
Topic: 1370 Message: 1370

For those who are interested, there is an article in the WIA magazine "Amateur Radio". Part one appears in the April edition, and I assume that another part (possibly more?) will appear in following editions. For those who are not subscribers to this magazine, it is now being sold in some news agencies.

Hi Jim - it deals with the early formation of the originators of Codan, the original equipment they constructed, and the how they moved along with technology. May not interest all of us, but it filled in some of the many gaps in my Codan knowledge.

The first 2 digits of Codan stuff indicate year of design/manufacture.

3528 would equate to something made in 1935. Probably be a bugger to
get spare parts now... :-)

1380. Power problems

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-04-25 11:03:20 UTC
From: Mark
Topic: 1380 Message: 1380

OK Group,

A little help and suggestions required.

I have a continuing problem with the low batt warning beep on Tx when the motor is not running.

I have a relatively new aux battery, off which the 9323 is directly wired through the original Codan fuse and 6m power cable.

With the multimeter attached to the battery on Rx, voltage is, as you would expect about 12.5 volts or thereabout. On Tx, say during a selcall transmission, at the battery, the voltmeter drops to about 12.2....but the radio is giving me the 'low batt' signal and warning beep. I can't understand this as Codan says this will only alert if the voltage drops below 10.5 volts.

I have cleaned the connections at the radio and the battery and all looks in order there....could it be a circuit fault?

Anyone else have this or similar problems?

Any suggestions welcome..... thanks in advance.

Mark

Mark, does "the original Codan fuse" mean you are using one of the cartridge type fuses? If so chuck it. They can get dirt etc on the connections and give the fault you have.
Cheers
Jim
PS are you reading the voltage at the battery or the tranceiver? Just a thought

Hi Mark
Check the voltage (on transmit)at the radio plug and
see what it is. You might have a bad joint in the
fuse, or something like that.

Jim,

I still use the original codan cartridge type fuse. I guess that could be the prob. What would you recommend to replace it as they suggest not using those cheap in line plastic fuse holders.

Circuit breakers perhaps? Do you use these or fuses in both the earth and power lines? Any more info appreciated.

Cheers,

Mark

Jim,

Might give all the contacts a clean up first and then a spray with the waterproofing stuff that I use on the battery terminals....Lectra Shield I think it's called. Got this idea from a mate who installs lots of radios and he swears by it (not at it!!)

If I then still have problems, I will go to the auto elec.

Thanks for the help,

Mark

Jim,

Hi guy's. I'm new to this group but I'm also a radio tech by trade. I was having a similar problem to this a couple of weeks ago with a guy who had done his own HF install. He had a 24 volt Nissan and had connected the +ve lead to one battery and the -ve to the vehicle chassis. Went fine on receive but when on transmit the supply rail went down to about 11.5 volts although the battery itself only went down to 12.2 volts. I found that there was a resistance between the -ve battery terminal and the chassis of 14 ohms. Cleaned the connections and the resistance went down to 5 ohms. Between the earth strap and the cable lug fitted to it was where the resistance was, inside the crimp itself. Replaced the earth lead with a new one and the problem went away. Interesting fault as it was only the HF that was effected as all the other vehicle functions worked as per normal.
Moral. ALL radio connections should be made directly to the battery

Hope this may help.

Subject: [codan_outback_radio] Re: Power problems

Jim,

Might give all the contacts a clean up first and then a spray with
the waterproofing stuff that I use on the battery
terminals....Lectra Shield I think it's called. Got this idea from
a mate who installs lots of radios and he swears by it (not at it!!)

If I then still have problems, I will go to the auto elec.

Thanks for the help,

Mark

Mark,
I use the original cartridge fuses on the fleet I look after. Never have any problems with them apart from the occasional one vibrating out on some roads.
If you replace it with a househol circuit breaker, bear in mind they are rated for AC. You have to de-rate them for DC (check withbreaker manufacturer, some will not DC rate them at all.) You can buy DC only breakers.

cheers
Ben

Topic: 1388 Message: 1388

G'Day,
r.I have just joined the group and am interested in purchasing a HF radio. At this stage I cannot probably afford a new one especially the NGT. I am the owner of a Toyota 80 series landcruiser and have done some remote trips and would like to do some more with the added security of communications. The questions I have have probably been asked many times before. Could someone possibly assist with some answers or point me in the direction where I may be able to research myself.

When buying second hand, the units have probably already been removed from the vehicle. In this case how do you ascertain if the unit works and that all functions operate normally.
Not having much of a knowledge of electronics is it better to purchase a unit via a dealer and get some warranty period

What is the difference between the 8528 and later models. I have just recently learned that the first 2 digits indicate the year of manufacture. Are there any differences in the auto tune antennas I think it is 9350 and 8550 or similar.
Are there any differences between Codan and Barrett.
When away on a trip is it possible to converse with family on any pre arranged frequency or do you need to subscribe to Radtel or similar to be able to achieve this.

Thankyou in anticipation.

Kind regards

Glenn Vaughan

Date: 2003-05-08 11:01:33 UTC
From: Steve
Topic: 1394 Message: 1394

what price should i pay for a 8528 with remote head and a 8558 antenna?

Was bidding on ebay for one with a faulty antenna but it went for to much or am i being to tight?

It closes tonight and is at $930 with thye stuffed antenna.

Thanks
Steve

mmmm...u can discount a stuffed aerial. So you are bidding on a 28 only. Price of 28 anywhere around 750-1K...plus an autotune. 8558 going at moment from between 350-450. You can do better than these prices occasionally but .....
Cheers

A bit more than $900 I'd have thought, Hi I'm the successful bidder, I stuck 950 on it thinking it would go for around 1,200 and when I checked back, lo and behold it was sold to me. Seems to be very clean, good nick, wide band version with 27Meg, fully programmed etc. I'm hoping the antenna problem is to do with bush/drive slipping and other faults that are well documented on that excellent website about Codans.
Cheers

Thanks everyone,

In looking around under the bonnet, I found an old earth cable join that was loose and a little corroded...I forget about that join when I installed the power cable. I have fixed it temporarily and vwhalla...no more probs. It even seems to make the antenna tune a little better with less 'tune fail' signals. I will fix it properly when I have the time.....

Thanks again for the input.

1400. 9323 stays on

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-05-16 04:57:36 UTC
From: Jim
Topic: 1400 Message: 1400

Hi. My 9323 has developed an interesting fault. It stays on at the last lot of settings I put in. Disconnecting the mic and power cable doesn't do anything, when the power is applied it simply comes back on and the controls are locked in their last position. Any leads before I pull it out of the vehicle ?
Cheers
Jim

1401. 8528 head wanted

Hi fellow Codanians, I just sold my 8528 remote, it started life as a 8525B, I purchased a 8533 remote head (from Ben), installed the LSB option and inc 27mhz in the programming, dam nice radio, I sold it for $1100, I`m useing that money to buy a 9350 auto tune ant. and I am going to use it with a Icom IC706 (MK1). I`ll keep you posted on how that all works out, cheers Yobbo

Sorry Jim, I think you might have the wrong Yobbo, I have never been to Canberra, and unless politicians are listed as feral vermin I most likely never will, I actually got given the 8525B from a transport company after I reprogrammed a few of there commerical two way radios, The radio did not work ,and a tech friend of mine fixed it for me, another tech friend of mine modified it to a 8528 and added the options, (he also sold it for me) I really don`t need HF for the 4wd`ing I do (Fraser, Morton, Double island ect) and I have decided to use my IC706 instead and as I can now afford to buy a new 9350 now I have sold my 8528, thanks Yobbo

Well I dont know what GME and Simoco think of this, but I am sure Codan will not view this favourably. A lot of time and effort goes into developing any software and manufacturers dont like seeing pirate software so blatently advertised on the www. Yes it is out there, but by selling it you are promoting breaking of copyright rules. Remember a month or so ago what happened to the mob in Sydney selling pirate music....????

Hi Paul. Can't see any problem here as any 60 series owner going offroad would just have to take his Codan along :))
Surprised that there isnt a 60 series forum already. Everyone seems to have one. I used to have one myself until rust got to it. Wouldnt mind another decent 60 to throw my sons band equipment into.
Jim

1411. Wanted Codan 8528\9350

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-05-20 00:38:12 UTC
From: Mike
Topic: 1411 Message: 1411

Hi,

My first Post, until earlier today I was unaware this group existed, notwithstanding I am a member of various other Yahoo Groups. My name is Mike. I am an Amareur Operator with an open license. Call sign VK4 MT. My wife and I are about to depart Brisbane for a 10 - 12 week trip, towing the caravan and heading in the general direction of Darwin (where we have family). I usually have my aging Yaesu Amateur HF set on board the Landcruiser. But it has died on me and the time has come to update. I like the codan as it gives me access to the Amateur bands as well as many other option, as you all well know. I have done a little bit of homework and asked a lot of questions, I would like a second hand 8528\9350 combination.
If anyone knows of one for sale somewhere either in Brisbane, or on route to Darwin, we can detour either on the outwards trip or on the way home.
Thanks,

Mike T.....\\

Check out Ben's site for ways to access the amateur network from a
9323. It works well, though perhaps not as convenient as in the
8528.

Mark

Topic: 1411 Message: 1419

Thanks everybody, I appreciate the comments and advice. I would prefer not to hire, but it will seem strange not to have HF cover. My wife and I spent 32 months driving around Aussie a couple of years ago. A total distance of 83000 Klm. And "yes", we have seen and tasted the "red" stuff and went to extraordinary lenghts to keep it out of the caravan. We failed miserably....."ah Yes...I remember well the road leading from Tom Price out to the main highway.

Anyhow, enough chit chat...will someone please find\offer me a second hand 8528\9350 combination and arrange for it to be installed in the cruiser (HJ60-1982...375000 on the clock) before Friday???.....\\

ok

well let me see i think i might have to try and apogise to some people out there who think i am pirating well in a sence i spose i am but all the files and sofware on this disk is available off the net all i am doing is saving the people the hassle of finding it all any way apart from some of you there has been a great respose like i said i am charging 25 buck for the disk to cover my own costs and time if this seems unreasoble please try to do better hey anyway i thought you lot would be happy about it look in a way it is my protest to the manufactures i mean $3000.00 for a program thats right it wasent a typo how rediculess what are they thinking $1000.00 for a radio then that for the programing it would be cheaper to buy 3 radios then get them programed somware else

sory if i have offended any one i thought i was helping

1426. 9323 and Amateur Frequencies

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-05-21 08:48:48 UTC
From: Mike
Topic: 1426 Message: 1426

Further to my Thread on my need for a 8528\9350 and the resulting offer of the 9323...etc...etc

I understand there are limitation on the use of the 9323 on the Amateur frequencies. However, I understand that the 9323 WILL allow me to select\tune and TX any specific frequency within a very large sprectrum. For example, please, with a 9323...is it possible to select and TX on say, 14.116Mhz (this is within the Amateur 20 Metre Band)...and if I can select and TX on 14.116, will I be able to scan\clarify\QSY to say, 14.130 Mhz...or would I have to separately "select" 14.130?

Any clarification would be appreciated....Thanks.....\\

You'd have to enter the QSY freq seperately after contacting on the Travellers Net, unless you already have these two frequencies entered into the 9323 program.

No. I mentioned this in an earlier post. The 9323 is not user friendly in this respect, only the rx can be actually tuned. Discussions with Codan confirmed that there is apparently no amateur option, not only did this prove a disappointment to us but also to amateurs that work for them :))

1436. Amateur Frequencies

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-05-21 13:43:54 UTC
From: bigpauljones
Topic: 1426 Message: 1436

I saw an NGT programmed by Lara Communications (between Melbourne and Geelong) with all of the VK Travellers' Net frequencies in it.

Couldn't help myself, and had great fun on the 20m frequency.

The problem is that I had to buy one - smooth talking bugger that Peter is :-)

And before you ask, I sold the 9323!

He also told me that Codan now have 500W and 1kW amplifiers available....

Paul (and his NGT)

Jim
Clarify a bit here, the option A (amatuer option allows free tune on TX freqs only within Aust amateur bands. Outside that is RX tune only. Option E which is a seperate option (and not usually found with option A) only allows programming of P channels (up to 99) without having to go through the usual bridging of the programming links inside the transceiver. Option E does not allow free tuning of TX freqs, so it is of limited use anyway

Cheers
Ben

I'm still a bit confused but nevertheless I'm sure you're right. According to my Codan sheet when installing option A, "Option TXD or TXE is still required and operates in the normal way".
Yes the "free tuning" of the tx and rx functions is only within the amateur bands.

By default all 8528s have TXD insatalled which prohibits TX freq
programming of P channels (programming link shorted excepted...)
So you will either have TXD or TXE, not both.
As I understand it TXE was only available to certain goverment agencies
, ACA of course and anyone else needed ACA approval before CODAN would
sellit to them.

Topic: 1447 Message: 1447

I need advice on this one please. I have just received an email offering

"a 2 - 3 year old current model Codan NGT AR for sale as of Wednesday next week (29th May)"

Can someone please give me a run down on where the NGT fits in relation to the 8528 and 9323 and whether it will give me access to the Amateur Bands as well as the normal range the 8528\9323 allows.

Thanks,

Mike....\\

Bout time you got rid of the crap Barrett TJL. Then you could
participate on this list instead of lurk :-))

Cheers

Craig

Mike

Jim is right. The NGT is the current model. It has a combined mic/control head so its easier to mount. The DSP is absolutely brilliant. It is a bit hard to drive after having 8528's and 9323's so forget everything you know and learn again. After a few practice runs it is nearly foolproof. Pick a channel and talk. No tune button, its all done for you (you can still manually tune it if you wish...)
It will do 0 to 30mhz RX and 2 to 27 TX (it does CB, may go higher, I havent tried) It has no support for Amateur option. All programming is done with a computer, no EPROMs to burn (hooray!!)
I think they run at around $4000ish with a 9350 autotune new, so If the price is right grab it (or let someone else know... if Jim hasnt jumped on it yet..)
Have a look at www.codan.com.au for a bit of a blurb and some piccies.

cheers
Ben

Jim wrote:

Update....

Thanks everybody. I have done the deal on the NGT. It becomes available in Toowoomba on Tuesday of next week. We will delay our departure for Darwin a few days.

I have emailed Tony separetly thanking him, and advising I will not proceed with the 9323\9350(for info...the delay in getting that unit to Brisbane could have stretched a couple of weeks or so).

May I suggest, if other members are still interested in the 9323\9350 that they contact Tony direct.

Even I, with my very limited exposure to the world of Codan recognise and appreciate that $1750 for a NTG\9350 is good buying. For the information of the Group.....I understand from my source that there will be several "other" NGT\9350 combinations becoming available in the next week to ten days.(a current user is upgrading a fleet of vehicles) I further understand the asking price will be about $500 HIGHER than I was able to negoiate. There is nothing in any subsequent "deals" for me, I simply pass the information along as an expression of appreciation for the worthwise advice you have all offered me.
Should there be an interest, please email me direct. I will be in Brisbane until Monday.

Regards to all,

Mike....\\

1454. Codan NGT....Manual

I have spent much time on the Net searching for an "owners" (or similar) manual for the Codan NGT. I have not had any success. I have found manuals for the 8528 and 9323.

Does anyone know of a site where I could download some detailed info on how to drive the "beast"?

Thanks,

Mike.....\\

Mike,

When I purchased my NGT, there was a small Getting Started Guide (Spiral Bound A5, about 80 pages) and in the back of that was a CD. The CD is an on-line Reference manual. If printed, it's several hundred pages. I've got some contact details for a guy at Codan. Let me know if you need the contact.

1457. Letter from the ACA re EMR licence conditions

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-05-27 08:39:13 UTC
From: Andrew Maruskanic
Topic: 1457 Message: 1457

Hi,

How many other people today got a letter from the ACA advising them of new EMR licence conditions. My problem is working out what my average total power is. I am using a Codan 8525B in a mobile installation, so I suspect I am in Compliance Level 1.

Can anyone confirm that the Codan does not outpuit more then 100 watts?

Thanks

Andrew

Andrew
The 85xx series are rated at max of 125watts P-E-P. They are usually licensed for 100watts PEP, so you have to calculate the catagory based on what it is licensed for. We've just been down this track at work with base and mobile HF's. Despite that they realistically only ever produce 85-90w PEP doesnt matter, its licenced for a 100w so you calculate with that.

If you do the average power calculations (based on the 6 minute average), then you are very unlikely to exceed the 100 watt average power level which keeps you in compliance level 1 category. As such, to quote a draft copy of the letter I have "If your transmitter is a Compliance Level 1 category, you must still comply with the EMR limits, but you are not required to hold or maintain compliance records. You still, however, have a duty of care in the operation of your transmitter not to expose the public to electromagnetic radiation in excess of the health exposure requirements."

Andrew, we all got em today :)) I couldn't see a mobile 8525 and atu overstepping the level1 conditions unless you had a rather large amplifier between the two.
Basides, the general idea is not to expose the public to dangerously high levels of radiation. Kangas and emus dont count. And if there were people around you'd be too busy worrying about them to do too much operating I guess :))

Codan will be offering a firmware upgrade to the NGT to enable option "A" (free tune tranceive in the amateur bands). This will involve a password from Codan to enable the option. Older NGT's can be upgraded by Codan dealers who will of course charge to do this.
This facility is being trialed at the moment and is expected to be availiable in the next couple of months.

Cheers
Jim

Hello All,

A friend of mine is selling his Codan NGT HF Radio from his 80s.
There is a Genuine reason for selling the radio! Please Don't stuff this guy around if you phone him, you don't like to be stuffed around so please respect his price etc.
He wants approx $3k [normally $3.9k] for a complete NGT including every box and instruction sheet etc and it is only one year old!
Two year warranty still on it. Nothing in it for me! I seriously considered it though.

Please hit me offline for details etc.

1470. NGT and Hash (White Noise)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-06-07 23:45:48 UTC
From: Mike
Topic: 1470 Message: 1470

Hi all,
Me again. I have arrived in Darwin. Had the NGT fitted in Toowoomba on the way through.(also fitted a "little switch" so I can play with the TX side of things...it works) But had to return to Brisbane for a day to have it reprogrammed and for some tuition on how to work the "thing". A very, very compact install and all operations are controlled from the "hand piece\microphone". Not the easiest of "toys" to understand as many of the "buttons" (and there aren't that many) trigger a differing response depending whether they are "pressed and released" or held (for a second). Once mastered, the concept is user friendly.

I am delighted with the signal reports I receive and likewise, reception is very satisfying.

However I do have a problem with WHITE NOISE and I would appreciate any advice or recommendations any one might have.

Mine is a mobile installation. When stationary, the reception is crystal clear. As soon as I start the engine there are signs of "hash". The hash\white noise increases as does my speed. It's as if the antenna (9350) is reacting to the "amount" of air passing over it. If I apply the MUTE ....then the noise disappears...(for info...on the NGT, MUTE equates to "squelch" on other sets I have used).....the NGT User Manual points out there have been several Terminology changes between the NGT and "other" Codan Models, I believe the renaming of SQUELSH (or similar) to the Button labled MUTE to be one of these changes.

As stated, with MUTE activated, the "hash" disappears, but so does any signal which is not strength 9, or at least close to it.

I am driving a 1982 Diesel Toyota Landcruiser. I have received much advice from various parties since the NGT install, and the current configuration sees the 9350 earthed to the negative side of the battery, the extreme end of the exhaust tail pipe is earth to the chassis...as is the engine block.

Does anybody else have any ideas of what else I can do to achieve "silent running" please?

Cheers,

Mike.....\\

Mike, the HJ60 often had a problem with the temp sender gauge. Does the noise disappear if stationary with the motor running ? If not try pulling the wire off the sender unit and see what happens. Also the fan could be the culprit, along with the wiper motor.
Cheers

Hi Mike,

I had similar problems to that which you are experiencing with my 8525 in my petrol '84 Landcruiser - mine turned out to be coming from the Oil Pressure Sender - just make sure your oil is topped up and then unplug the wire running to the Oil Sender and see how you go.

Hope this helps,

Tom.

Tks Jim.....Yes...the noise does almost disappear when the vehicle is stationary and the motor is still running....as I said ...the symptoms are the more "air" passing over the 9350.....the greater the noise).
I will disconnect both the Temp and Oil Sender units tomorrow. But what would you suggest I do to mask any "noise" coming from the fan?.

I continued to trouble shoot the problem this afternoon...and find the "noise" lessens considerably each time I dip the clutch to change gear. Obviously, the need to use the clutch driving up from Brisbane was infrequent, but in Darwin suburban traffic I am changing gears with regular frequency. So.....the noise lessens when the vehicles drive chain (ie, clutch is pressed)is disconnected.

I will let you all know how I progress.

Regards,

Mike.....\\

Hi,

I have an HF set in my Toyota and over the years have done many land mobile RT installs in both Toyota 4WD's and Toyota cars. It seems to be a common Toyota problem. I was going to suggest that you depress the clutch and see if it goes away. I see you did this and it did which is pretty normal. I have often wondered if it is maybe the thrust bearing or something to do with the loading of the gears??. If you think the problem is bad you need to try one of the new Landover's, especially the Defender series, 90's appear to be the worst. When the motor is running the hash from the computer system kills anything with a receiver within a radius of about 5 mtrs of the vehicle.
I have an Isuzu Bighorn (Holden Jackaroo) which only generates problems when the wipers or air conditioning is running. When I had an non remoted set in the Toyota the performance was far superior compared to the remoted one now in it which leads me to think that the interference is getting into the cable between the remote head and the radio more than coming in the antenna.

Regards,

Malcolm Langley

Thanks malcolm,

All points noted. Note that it is getting any easier. I am not sure re: the noise entering via the cable between the remote head and the radio (more than coming in via the antenna).....I find if I disconnect the Co-ax at the base of the 9350...the noise stops. As a matter of interest I wrapped some of "Mothers" Alvoil (Aliminum foil from the caravan)around the 9350. I found, if I wrap the complete Tuning portion of the 9350 (the black bit)...the noise was lessened markedly. Of course, the antenna will not work properly when so wrapped, and I have since found out the top few inches of the 9350 are indeen part of the "antenna" rather than the "tuning unit", which I understand is located in the lower portion(s) of the black bit.

If I wrap foil around the 9350 except for the top 6 inches of the "black bit"....then the antenna works, but I cannot "tune" below 5 megs....and the noise starts to return (as compared to a situation when the full black bit was enclosed in foil).

Not sure what this tends to prove, other than the noise seems to be "flowing" through the antenna\co-ax.

It's still dark here in Darwin, but I will disconnect the various Sender Units during the morning. I must admit I have a bit of a "hang up" about this action being a solution as I thought any interferance\noise generated via these units would have sounded like a "tick...tick...tick" sort of thing rather than "hash"?

I am hoping I am completly wrong, and that my problem is about to be solved.

Cheers,

Mike.....\\

For Nissan owners info, the current Patrol has a few inbuilt noise makers. Seems to affect HF, commercial and CB bands (DC to Daylight...) One is the wiper motor and the other is the additional fan fitted to AC models. The fix for the fan is to pull it out, run an earth wire to the motor body (its mounted in plastic) and then put a 1uF capacitor from the +12v supply to ground. Cleans it up 90%.
The fix for the wipers is to hope it doesnt rain..... Seriously a 1uF capacitor connected the same way quietens it up.

Another install tip is to make sure you run the control head cable on the opposite side of the car to the antenna and power cables. Also try to steer them away from any computers (engine, ABS, body etc)

cheers
Ben

Hi Mike,

About 3 years ago i installed a couple of hundred Raywood Data, GPS, radio systems into taxis over here. One of the things the Aussie guys were most insistant on was that we connected a cable from the battery to the nearby suspension/ shock body mounting bolts, thsi was to ensure that there was a good bond between the battery negative and the vehicle chassis. Many -ve straps are run directly to the motor with nothing deffinate to the chassis. The reason for this was also to help lower interference levels from the chassis as quite often, due to rubber mounting supports there can be no real places on the chassis where the motor/ gearbox etc is physically/ electrically connected to the body of the vehicle. (Refer as below to an earlier email to the group on a similar?? type of problem)
You could try connecting an earth strap from the gearbox to the body work. Remembering of course that no doubt the antenna is bolted to the body of the vehicle (bumper bar or whatever) and when you remove the antenna cable the body of the vehicle not only looses the antenna connection but also the earthing that is provided in the shield of the coax cable. Inside the radio, the Negative power supply is no usually connected to the metal box of the radio except by capacitors, this allows for installation to either +ve or -ve chassis vehicles. Therefore, the -ve battery connection could, unless you have used the earth connector on the back of the radio and connected this to the chassis, only be connected together with the outer box of the radio when the aerial plug is connected to the aerial. I.e. The only electrical earth the radio chassis has is via the aerial cable. If this were so, the interference could well be entering the radio via the shielding of the aerial coax running parallel to the centre conductor of the coax.
You usually get the tick, tick from petrol motors spark distributor, plugs and leads.

Good luck

Regards,

Malcolm Langley
www.on-track4wd.co.nz

OK Group,

A little help and suggestions required.

I have a continuing problem with the low batt warning beep on Tx when the motor is not running.

I have a relatively new aux battery, off which the 9323 is directly wired through the original Codan fuse and 6m power cable.

With the multimeter attached to the battery on Rx, voltage is, as you would expect about 12.5 volts or thereabout. On Tx, say during a selcall transmission, at the battery, the voltmeter drops to about 12.2....but the radio is giving me the 'low batt' signal and warning beep. I can't understand this as Codan says this will only alert if

the voltage drops below 10.5 volts.

I have cleaned the connections at the radio and the battery and all looks in order there....could it be a circuit fault?

Anyone else have this or similar problems?

Any suggestions welcome..... thanks in advance.

Mark

> Hi guy's. I'm new to this group but I'm also a radio tech by trade. I was having a similar problem to this a couple of weeks ago with a guy who had done his own HF install. He had a 24 volt Nissan and had connected the +ve lead to one battery and the -ve to the vehicle chassis. Went fine on receive but when on transmit the supply rail went down to about 11.5 volts although the battery itself only went down to 12.2 volts. I found that there was a resistance between the -ve battery terminal and the chassis of 14 ohms. Cleaned the connections and the resistance went down to 5 ohms. Between the earth strap and the cable lug fitted to it was where the resistance was, inside the crimp itself. Replaced the earth lead with a new one and the problem went away. Interesting fault as it was only the HF that was effected as all the other vehicle functions worked as per normal.

Thanks everyone,

In looking around under the bonnet, I found an old earth cable join that was loose and a little corroded...I forget about that join when I installed the power cable. I have fixed it temporarily and vwhalla...no more probs. It even seems to make the antenna tune a little better with less 'tune fail' signals. I will fix it properly when I have the time.....

Thanks again for the input.

Mark

No problems, glad you found it and I could help out. Damn earth cables get you every time. Probably make starting, charging and the rest of the electric in the vehicle work better as well.

Regards,

Malcolm

Subject: [codan_outback_radio] Re: NGT and Hash (White Noise)

Thanks malcolm,

All points noted. Note that it is getting any easier. I am not sure re: the noise entering via the cable between the remote head and the radio (more than coming in via the antenna).....I find if I disconnect the Co-ax at the base of the 9350...the noise stops. As a matter of interest I wrapped some of "Mothers" Alvoil (Aliminum foil from the caravan)around the 9350. I found, if I wrap the complete Tuning portion of the 9350 (the black bit)...the noise was lessened markedly. Of course, the antenna will not work properly when so wrapped, and I have since found out the top few inches of the 9350 are indeen part of the "antenna" rather than the "tuning unit", which I understand is located in the lower portion(s) of the black bit.

If I wrap foil around the 9350 except for the top 6 inches of the "black bit"....then the antenna works, but I cannot "tune" below 5 megs....and the noise starts to return (as compared to a situation when the full black bit was enclosed in foil).

Not sure what this tends to prove, other than the noise seems to be "flowing" through the antenna\co-ax.

It's still dark here in Darwin, but I will disconnect the various Sender Units during the morning. I must admit I have a bit of a "hang up" about this action being a solution as I thought any interferance\noise generated via these units would have sounded like a "tick...tick...tick" sort of thing rather than "hash"?

I am hoping I am completly wrong, and that my problem is about to be solved.

Cheers,

Mike.....\\

land mobile RT installs in both Toyota 4WD's and Toyota cars. It
seems to be a common Toyota problem. I was going to suggest that you
depress the clutch and see if it goes away. I see you did this and it
did which is pretty normal. I have often wondered if it is maybe the
thrust bearing or something to do with the loading of the gears??. If
you think the problem is bad you need to try one of the new
Landover's, especially the Defender series, 90's appear to be the
worst. When the motor is running the hash from the computer system
kills anything with a receiver within a radius of about 5 mtrs of the
vehicle.
> I have an Isuzu Bighorn (Holden Jackaroo) which only generates
problems when the wipers or air conditioning is running. When I had
an non remoted set in the Toyota the performance was far superior
compared to the remoted one now in it which leads me to think that
the interference is getting into the cable between the remote head
and the radio more than coming in the antenna.

G'Day Tom , mike et al,

The early Toyota Landcruidser has a reed type oil pressure sender switch. This creates a RF that will interfere with HF radios. place a 0.47 uF capacitor across the terminal and earth and all should be OK, I hope? To test this before fitting a Cap, disconnect as suggested to see if the whine noise disappears? the other problems are alternators and body bonding separation due to electrostatic etc. earth straps across all panels doors bonnet etc will fix this noise. in all the military vehicles that I've been involved with they have had all the panels earthed bonded.

Regards
Terry

My $0.02,

I have a HJ60 land cruiser as well and my first HF radio in the vehicle suffered a similar fate. My antenna was mounted on the Bullbar.

I made a short earth strap from the alternator to the body of the vehicle and this removed 80% of the noise, I have also bonded the bonnet to the body of the vehicle.

I would expect your antenna base to have an earth strap to the body of the vehicle as well.

Just a quick note for 60 series, the Tacho sender can create a noise (similar to alternator whine) which will change in frequency with the engine speed. (Tacho sender is located on the bell housing)

Other sources of Hash noise may be switch mode battery isolaters and fridges.-but if you say that the noise is relative to your vehicle speed a loose or crook antenna connection is a possible cause.

I hope this of some help.

Regards

Paul

Hi all.

Thanks everybody for help and assistance.

An update.Current config:....9350 earthed to negative terminal on battery.....engine block earthed to chassis.....tail pipe earthed to chassis.....oil sender unit disconnected, and aluminum foil wrapped around the 12 volt cable and antenna co-ax cables as they pass thru the engine compartment.

The oil sender unit was my big surprise. I simply did not think it possible that disconnectiion could make such a differance. The "white noise\hash" was reduced by at least 90%. Of course the oil guage doesn't work. Two auto electricians here in Darwin swear it is not possible to suspress the oil sender unit and still have the oil guage (dashboard) working at the same time. I am still working on this one. Any advice or comments please as I must have the guage working...for obvious reasons.

In the current configuration, the "white noise" has been reduced to almost manageable proportions, and with it "gone" I can "hear" the "tick...tick...ticking" of electrical interference being generated somewhere.

I am going to seek advice of another "auto sparkie" later today.

Will update in a few days .

Cheers,

Mike....\\

Mike,

Do you have dual batteries and is the Codan attached to the main battery. Wondering if there is feedback from the electrics through the battery. I have mine attached to the body rather than to the battery. Maybe a move of earth to the second battery may isolate this. I know on 80s the main battery is on the passenger side.
Cheers

Craig

Topic: 1470 Message: 1486

Hi,

I have two batteries. The first is situated front of vehicle on right hand side. The second is fitted front of vehicle left hand side and is immediately behind the 9350 which is fitted to the Bull Bar.

The second battery is separated from the first (prime) by a manual isolator switch. The first battery (right hand side) is dedicated vehicle start. The second battery (left hand side) is dedicated cigarette lighter, caravan 12 volt feed, and Codan.

The 9350 was originally earthed to bull bar AND chassis but on advice was re-earthed to negative side of the second (left) battery. The change did NOT make any apparent differance.

The Codan is located under the passengers seat and is earthed to seat support which in turn is earthed to floor. Codan 12 volt feed (positive) and negative run down left hand site of engine, as does the co-ax and other cable supporting the 9350. The 12 volt feed positive and co-ax have been wrapped in alfoil in the engine bay.

And the saga continues. Trying to find 12 volt HF suppressors etc here in Darwin is proving difficult. I spoke to auto electrician this afternoon. He suggested I go to Dick Smith to get .47 Mf Cap and an inline 12 volt filter. I rang Dick Smith staff rather than drive the distance. The first person I spoke to asked what was "HF".....the second wanted to know how to spell "filter" so he could do a computer check of available stock.

Cheers....Mike...\\

1487. Re: [codan_outback_radio] Re: NGT and Hash (White Noise)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-06-11 13:31:45 UTC
From: Sam Point
Topic: 1470 Message: 1487

Hi Michael, well it is only to be expected with Dick Smiths now being owned by Woolworths, it is now a "retail" store not a "Technical" store. Try the ships chandlers near the Darwin Port as most large vessels/fishing boats are fitted with HF and do suffer interference. The other reason is most of the filters supplied by Dick Smith/Tandy max out at 10-15 amps and the safety margin for a Codan is around 35 amps. I fit 30 amp resetting circuit breakers to all the units I maintain in the fleet as they are operating from Birdsville to the Gulf and back towards Townsville and supplies of the large fuses are hard to get in one horse towns :-). The circuit breakers are also used as they aren't prone to causing interference with coatings of "Bulldust" in the dry dusty outback. Once cable lugs are fitted to Breaker, coat connections with "Viscotene" to prevent corrosion and damage from bore water and engine coolant spills (Broken
Hoses :-) .).
I drive an '86 model 75 series troopie and I have learn't to put up with the oil gauge noise, everything else on the vehicle is bonded, even the 8528 control head (As per a Codan Technote we received at work.) is earthed. I haven't noticed the "Noise" problem so much with the codan 9323 fitted 100/105 series and 78 series vehicles in the fleet here and we only have one NGT which I re-installed in a new vehicle 2 weeks ago then it took me 20 minutes and finally resorting to the manual to do a beacon and selcall test! I hope Codan does some more work on the menu and driving software, our whole statewide fleet is supposed to change over to NGT's early next year and I know that a few Microphone control units will exit windows at 80 kmh due to operator frustration if the system isn't simplified better than the existing "Phonebook" call list setup. :-) ;-) . Apparently there is an "English" worded overlay for the Mic/Controller available from Codan so you don't have to remember cryptic symbols and what they do.
Try "Jaycar" if there is one in Darwin, they are still tech minded.
A bond between engine and bellhousing then to chassis with braid loops on the gearbox mounts on "H" motored cruisers used to clear up "Static noise as well. Also did you remove all paint for 10mm around mounting hole on top of bracket that the 9350 is mounted to? Coat with "Contact Lubricant" to enhance contact and prevent corrosion after doing. Do the same to the location where the earth lead connects to the body/chassis. I always use the front mounting bolt on the top of the radiator shroud crossmember (Closest to battery!) (75/78/79) or where the battery tie down strap is bolted (80/100/105/Jackaroo.). This is on 100's and 78's though 80's and 60's aren't much different.
Regards,
Sam Point
Townsville FNQ.

From: Paul
Topic: 1489 Message: 1492

Hi all,
I have a 8525B and it appears that the radio has to be in USB mode to tune. Is this correct? According to the destruction manual you should select the mode first. proir to tuning.

On LSB the radio just comes up with uT. (un tuned error) It appears as if there is no Power for the radio to tune with. ON USB the radio tunes no worries. I came first came accros this when I went to align the LSB reference osc. According to the manual all you need to do is press the Tune button but this did no appear to work.

BTW my 8555 antenna (Moonraker autotune-early Codan version) appears to work OK with the option AD board.

Regards

Paul

Paul
USB/LSB is irrelevant with tuning (well it should be anyway) because the radio actually switches to AM carrier to tune the antenna. This is how I came across the AM mod.
If you get an untuned error on LSB I suggest that the VCO circuitry is crook.
cheers
ben

Thanks for the replies,

Radio appears to operate OK on both
USB and LSB. (Note: LSB XTAL is fitted.)
Even when the radio will not transmit on the TUNE command on LSB, mic audio is no problem and the radio will transmit. If this was a VCO problem I would of thought it was common to both the tune command and LSB voice etc.

I will bear in mind that it may be a VCO problem as I did have a strange problem today where the radio mid transmission kept going to "uT" on 40M LSB. I checked the tuning and it was OK. The station that I was working did not have any problem copying me. I have not had any problem on other channels both USB and LSB,

Is it possible to expand on any further explanations??

Thanks in advance,

Paul.

From: Paul Dudley
Topic: 1499 Message: 1499

evening all,

I have had a look at the broadband antenna that is on the file list today and was wondering if anyone out there has used one/built one?/

I would be interested to know they compare to other antennas (eg dipole, multi band /monoband)in regards to performance etc. Are they a compromise antenna??

Are there any other broadband designs that anyone know's about??

Regards

Paul

Peter
go to the groups home page at
http://groups.yahoo.com/group/codan_outback_radio/

on the left side of the page you will see some links. Select the one
that says 'Files'

Much good info can be had there and in the photos section.
cheers
ben

Topic: 1502 Message: 1503

Dick Smith used to sell one similar to the one on the left but they will probably be more inclined to sell you a Karaoke mic now...

Find a local machine shop and get them to make you an adaptor to suit. I had some made for around $5 each. Brass will do if you cant get stainless steel ones.
cheers
Ben

Hi Paul, I have the Bushcom BBA100 . Have been disappointed with others so I didnt expect much. Pleasantly surprised. Whilst its no beam or quad, it certainly lives up to its design criteria.

Subject: [codan_outback_radio] Broadband antenna

evening all,

I have had a look at the broadband antenna that is on the file list today and was wondering if anyone out there has used one/built one?/

I would be interested to know they compare to other antennas (eg dipole, multi band /monoband)in regards to performance etc. Are they a compromise antenna??

Are there any other broadband designs that anyone know's about??

Regards

Paul

Hi,
I recently got the one one on the left at DSE BUT, there is always a
but, the ones they have are 1/2"UNC to 5/16"UNF - the 9350 has a
14x2mm thread.

I got hold of a 14x2mm tap & rethreaded the adapter. Works fine with
a S/steel whip.

cheers
Tony

I'll have to try it. I have a ss whip here just waiting to be used. Might fare better than the Codan whip on the trees and garage flouros. It does appear to whip around a fair bit when mobile. I wonder if the tuning range of the 9350 changes much?

Tie it off with fishing line (if mounted on the rear of the vehicle). About 1/2 way up

That will reduce the oscillations significantly.

1508. Many questions and one old 7727tb

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-06-20 01:52:38 UTC
From: Dark Desires
Topic: 1508 Message: 1508

Im searching for some info (a manual would be nice)
on one fairly old 7727-tb model Codan that has a A5151
remote head, and connected to a manual whip.

Just the basics would be sufficient. How old the unit
is (roughly)... and what is its output?

More detailed questions though that would require
either knowlege of the unit or experience with them..

On the head unit there is a toggle switch or mode
switch, with three options Tune/AM, USB and LSB
Can anyone tell me what this is used for, (I suspect
it may for use with an Autotune Antenna) and if it is
possible to use the 27Mhz band on a manual whip...?

On the rear of both the base and head unit their is a
female round 10 pin connector. (looks like a trailer
plug socket) What is it for? Auto Antenna?

On the 50 pin connector cable that connects to the
head unit, there is an off shoot cable from the
connector that has two pins. Is this an Earth?

I have had this unit now for some years, and never had
any problems with it.... Its been in storage for the
last 2 years, but Im now in process of mounting it
into its third vehicle. Hoping it still works, as I
imagine there wouldnt be many spares around anymore.

PS. Is there any problems with mounting the base unit
vertically on it side?

Lot of questions I know.. but life would be much
easier if I could RTFM.

Malcolm,
Thanks for that.
The Tune AM toggle switch, with the USB LSB threw me.
Didnt think I could use the AM 27Mhz... but never
hurts to ask.. esp when Im running out of spots to
bolt stuff in the vehicle.

Hi Ian,

27 mHz antenna would be that far off tune that you would probably only transmit about 5 watts.....Room is always a problem.....Take a bracket of about 1 & 1/2 inch Galv pipe out horizontal from the side of the tow bar with a bend in it to come up the side of the vehicle to clear door and tail lights. Bring it up to about 2/3 the distance to the roof. Piece of flat steel welded flat on top with a hole to mount the HF aerial base on. Works well. If you want a pic email me off line.

1512. Re: Adapters

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-06-20 04:15:34 UTC
From: Mark
Topic: 1502 Message: 1512

Peter,

I had these adaptors turned up at a machine shop for $25. Then took them to a chrome plating place..another $5. The first one they got wrong (which is the one on the right)...so they gave it to me. The one on the left is the one I use to attach a fairly cheap stainless steel whip to the top of the 9350. I also use a spring base which is easily purchased from DSE, Jaycar or similar shop. This set up works well and allows me to attach several different types of whip tops. I also have a really heavy duty stainless steel whip which is similar to the thick long one supplied by Barrett. I'll post a photo for you in the same section.

My only warning would be to ensure that whatever you put there is capable of handling 100 watts out....CB type antennas are usually only rated to about 50 watts max...

Cheers,

Mark

1513. Re: Broadband antenna

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-06-20 04:24:50 UTC
From: Mark
Topic: 1499 Message: 1513

Paul,

With an amateur friend of mine, I built this same antenna. It worked very well, but was not really portable enough to be useful...I mainly used it in a "mobile base camping" type arrangement when I was camping in one spot for an extended period of time (I used to teach outdoor education in some quite remote spots). I simply erected the ant high up from trees and had the coax hanging down so that I could drive the car under it and park it there, then simply plug the coax onto a coax switch to switch over from the auto tuner. There was a very noticeable difference between the two.

There is a photo of the 'left over' bits in my photos folder to show how we encapsuled the balun and other bits. The rest is just lots of wire... and rope to hang it all up..

Hope this helps,

Mark

I've acquired a remote control system (2 boxes) for these 77 things :) I presume that one box sits at the base (240v and 600Z lineout) and the other sits at a remote location (12v 600Zlinein) where a 7727 would be located. Anyone have any knowledge of such things?
Cheers

1515. Re: [codan_outback_radio] Many questions and one old 7727tb

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-06-20 05:15:38 UTC
From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 1508 Message: 1515

Yes that's right. Usually done over a radio interface these days. These units suffered from water in the lines amongst other things causing a hum on the line which of course everyone hears. Have seen the hum get to such a level that it causes the transmitter to lock on and transmit the hum continuously. good thing to throw in the rubbish bin :-))

Subject: Re: [codan_outback_radio] Many questions and one old 7727tb

I've acquired a remote control system (2 boxes) for these 77 things :) I presume that one box sits at the base (240v and 600Z lineout) and the other sits at a remote location (12v 600Zlinein) where a 7727 would be located. Anyone have any knowledge of such things?
Cheers
Jim

Subject: Re: [codan_outback_radio] Many questions and one old 7727tb

Hi,

How old the unit
is (roughly)... and what is its output? Approx 1977 & 100 watts

On the head unit there is a toggle switch or mode
switch, with three options Tune/AM, USB and LSB
Can anyone tell me what this is used for, Tune/am is so you can inject an AM carrier to tune an antenna

and if it is
possible to use the 27Mhz band on a manual whip...? Not sure what you are talking about here???? 7727 HF set NOT CB

On the rear of both the base and head unit their is a
female round 10 pin connector. This is for connecting a 8422 Selective call unit too

On the 50 pin connector cable that connects to the
head unit, there is an off shoot cable from the
connector that has two pins. Is this an Earth? No- This is the speaker connections

Is there any problems with mounting the base unit
vertically on it side? No problems. Mount it any way you want

Subject: [codan_outback_radio] Many questions and one old 7727tb

Im searching for some info (a manual would be nice)
on one fairly old 7727-tb model Codan that has a A5151
remote head, and connected to a manual whip.

Just the basics would be sufficient. How old the unit
is (roughly)... and what is its output?

More detailed questions though that would require
either knowlege of the unit or experience with them..

On the head unit there is a toggle switch or mode
switch, with three options Tune/AM, USB and LSB
Can anyone tell me what this is used for, (I suspect
it may for use with an Autotune Antenna) and if it is
possible to use the 27Mhz band on a manual whip...?

On the rear of both the base and head unit their is a
female round 10 pin connector. (looks like a trailer
plug socket) What is it for? Auto Antenna?

On the 50 pin connector cable that connects to the
head unit, there is an off shoot cable from the
connector that has two pins. Is this an Earth?

I have had this unit now for some years, and never had
any problems with it.... Its been in storage for the
last 2 years, but Im now in process of mounting it
into its third vehicle. Hoping it still works, as I
imagine there wouldnt be many spares around anymore.

PS. Is there any problems with mounting the base unit
vertically on it side?

Lot of questions I know.. but life would be much
easier if I could RTFM.

Jim
even with the Codan type stainless whip you cant tune below 2.5 meg.
They just aren't long enough. Even with the longest s/stell whip I can
source from RFIndustries 2.4 meg is as low as I can go.
Some whips do break off at the base with time due to vibration. But at
the price just carry a spare behind the seat..

Ben,
I have a quite long SS Whip similar to that supplied with the Barrett sets. It is a very heavy duty whip and about 15cm longer than the original black Codan whip...it tunes from 2mHz right through. It does however need the spring base to avoid snapping off low down on the whip shaft...I've put a photo in my folder if you're interested.

Cheers,

Mark

Ben & the group,
I am curious about your comment that you can not tune a Codan S/S whip below 2.5mhz. Have I got something different in my setup using a 9323 into an A series 9350 autotune???

After having my original Codan S/S whip break at the spring I have been using a S/S whip of 78cm (30.75")that I found and this tunes down to 2.648mhz & communicates quite well.
With a short spring adapter from DSE the length comes up to 84cm (33") and that combination tunes down to 2.360mhz & I have used it to talk across a fair bit of Au on the VKS network & others on all of their frequencies. I use this setup most of the time around town as it keeps the whip out of most trees on nature stirps that hang over the road & when bush bashing.

Out of interest I measured my whips & tested what they tune down to & communicate clearly with other stations.

Codan F/Glass whip = 158.75cm (62.5")
tunes down to 2.020 RFDS

NEW style Codan S/Steel whip = 128.5cm (50.5")
tunes down to 2.260 RFDS

OLD style Codan S/Steel whip = 84cm (33")
tunes down to 2.260 RFDS

Home brew S/Steel whip with spring = 84cm (33")
tunes down to 2.360 RFDS

Home brew S/Steel whip without spring = 87cm (30.75")
tunes down to 2.648

I have found the new Codan whip is VERY flexible & bends back a fir bit when you are cruising at 100km/h in no wind, I cant begin to imagine how much it will lay back in a good head wind.

Cheers
Tony

1520. Toyota Landcruiser.....NGT..... and noise

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-06-23 07:18:36 UTC
From: Mike
Topic: 1520 Message: 1520

Hi all,
Me again. I am still in Darwin, and still trying to trace the source of electrical noise in my setup. (1982 Toyota Landcruiser Diesel and a NGT with 9350 Antenna)...see previous Posts

The remaining noise is "electrical interference" and is the very fast tick, tick, tick. It is NOT evident at idle speed. It appears at about 500 RPM and gets louder. At operating speed (2000 RPM) the noise drowns all but the strongest audio signal. I cannot use the NGT in a "mobile" role and have to stop vehicle to RX|TX.

Current configuration sees....Caps\filters on Oil Sender, Alternator, and Tacho. A 40 AMP Filter (Jaycar) has been placed on the Codan positive feed. All Codan and aerial earths have been removed\repositioned. Tail pipe (exhaust) is earthed, as is bonnet and gear box.

Codan dealer in Darwin replaced the 9350 (aerial) to confirm "it" was not the source of the problem.

I (we) have been considering updating the vehicle for some time, and the problem with this Codan may well be the final straw. I have a bit of rust, 375000 on the clock and the tyres will need replacing when we get home. Against that background, we have looked at other 4WD's in Darwin. (Not that I want to change over here). My frame is 6 foot 4 inches. The only 4WD vehicle that has enough leg room for me is the Toyota Landcruiser.....A question please.....Whats the word on fitting a Codan (NGT) to the 80 Series Landcruiser. Does anyone have knowledge of any "noise" problems with that model?.

The alternative would be a sedan, but I haven't seen too many 9350's fitted to the rear of a Commodore or a Falcon?.

Any comments on the existing problem, or future plans would be welcomed please.

Cheers,

Mike.....\\

Hi Mike,

As I said earlier the Toyota's alway generate noise problems. If you are considering changing if you went to maybe an Isuzu (Holden Monterey) or Nissan Safari. Both of which I have had with no interference except when the wipers are on I doubt you will have any further problems. I would like to go to a late model Prado but will be staying clear of Toyota's, well at least while I use HF sets anyway.
beware of late model landrovers with computer systems. They can generate noise up 2 a 2 mtre radius which nothing but the strongest signal will get thru.

Mike,

I too have the tick tick noise with engine revs. However, when I
first installed the radio I didn't. I can only put it down to poor
earthing somewheer or the route the coax takes as they are the only
things that have changed/worn.

I've got an 8528 to replace the 8525 in the truck, and I'm interested
to see if any of the engine generated noise disappears.

Hi Mike - I am also a landcruiser man (as expensive as it is, I still love mine), and running a 80 series diesel (94 model) and an 8528, I have absolutely no noises that I can hear in normal driving mode, and nor can I hear any interference on my Alinco DX70TH.
The windscreen washer does have quite a lot of noise associated with it, but nothing else - I cannot really differentiate between the engine on and off.
I have done nothing special with regards to earthing - all I have is the earthing strap from the base of the tuner fixed to the bullbar with a screw (about half way down the bar). No earthing/bonding straps between bar and chassis or panels. Maybe I am lucky, but no problem discernable with interference, and that is with the radio fitted for over two years.
My 60 series diesel was also the same (no RFDS fitted, just the Alinco) until I had a problem with the alternator (brushes were totaled BIG time). After the alternator was serviced, it went to the shite - continuous and very loud hash that was definitely alternator related (could tell what speed I was doing without looking at the speedo). Sold it shortly after, so never did bother to find the problem (non radio friend bought it, so he didn't care).

Matt

No probs with an 8528/8558 (except the tune problem that was fixed through the mod on Bens site).

It is slow to respond to a Sellcall but that's probably more to do with the time the 8558 takes to tune up.

Cheers

Craig

Which tune problem do you refer to? Only thing that annoys me is the noticeably longer time it takes to tune in compared to the 9350 antenna tuner. I find that the only time it is slow to respond is if it is in scan mode - probably like you said due to the slow tune when it stops the scan, tunes and then responds. When they are on the one freq (usually have mine sitting on a private one most of the time), they respond damn near instantly.
If there is a mod to speed up tune time, then please let me know - it is one thing that I would really like to speed up (a 9350 would of course be the optimum solution, but the cost of one is not to cheap.

Matt

No probs with an 8528/8558 (except the tune problem that was fixed
through the mod on Bens site).

It is slow to respond to a Sellcall but that's probably more to do with
the time the 8558 takes to tune up.

Cheers

Craig

| Subject: Re: [codan_outback_radio] Toyota Landcruiser.....NGT..... and
| noise
|
| Hi Mike - I am also a landcruiser man (as expensive as it is, I still
love
| mine), and running a 80 series diesel (94 model) and an 8528, I have
| absolutely no noises that I can hear in normal driving mode, and nor
can I
| hear any interference on my Alinco DX70TH.
| The windscreen washer does have quite a lot of noise associated with
it,
| but nothing else - I cannot really differentiate between the engine on
and
| off.
| I have done nothing special with regards to earthing - all I have is
the

| earthing strap from the base of the tuner fixed to the bullbar with a
| screw (about half way down the bar). No earthing/bonding straps
between
| bar and chassis or panels. Maybe I am lucky, but no problem
discernable
| with interference, and that is with the radio fitted for over two
years.
| My 60 series diesel was also the same (no RFDS fitted, just the
Alinco)
| until I had a problem with the alternator (brushes were totaled BIG
time).
| After the alternator was serviced, it went to the shite - continuous
and
| very loud hash that was definitely alternator related (could tell what
| speed I was doing without looking at the speedo). Sold it shortly
after,
| so never did bother to find the problem (non radio friend bought it,
so he
| didn't care).
|
|
|

noise
|
|
| Hi all,
| Me again. I am still in Darwin, and still trying to trace the source
| of electrical noise in my setup. (1982 Toyota Landcruiser Diesel and
| a NGT with 9350 Antenna)...see previous Posts
|
| The remaining noise is "electrical interference" and is the very
fast
| tick, tick, tick. It is NOT evident at idle speed. It appears at
| about 500 RPM and gets louder. At operating speed (2000 RPM) the
| noise drowns all but the strongest audio signal. I cannot use the
NGT
| in a "mobile" role and have to stop vehicle to RX|TX.
|
| Current configuration sees....Caps\filters on Oil Sender,
Alternator,
| and Tacho. A 40 AMP Filter (Jaycar) has been placed on the Codan

| positive feed. All Codan and aerial earths have been
| removed\repositioned. Tail pipe (exhaust) is earthed, as is bonnet
| and gear box.
|
| Codan dealer in Darwin replaced the 9350 (aerial) to confirm "it"
was
| not the source of the problem.
|
| I (we) have been considering updating the vehicle for some time, and
| the problem with this Codan may well be the final straw. I have a
bit
| of rust, 375000 on the clock and the tyres will need replacing when
| we get home. Against that background, we have looked at other 4WD's
| in Darwin. (Not that I want to change over here). My frame is 6 foot
| 4 inches. The only 4WD vehicle that has enough leg room for me is
the
| Toyota Landcruiser.....A question please.....Whats
the
| word on fitting a Codan (NGT) to the 80 Series Landcruiser. Does
| anyone have knowledge of any "noise" problems with that model?.
|
| The alternative would be a sedan, but I haven't seen too many 9350's
| fitted to the rear of a Commodore or a Falcon?.
|
| Any comments on the existing problem, or future plans would be
| welcomed please.
|
| Cheers,
|
|
| Mike.....\\

Mike, I have a 1Hz engine in my 80. Not a speck of engine noise. However I'm told that if you go to the later turbo systems ? with the different fuel injection systems ? *Jim's tech talk here* it could be a different matter.
Just a suggestion. Try and beg borrow or steal an old transistor radio that has a ferrite loop aerial and shortwave bands on it. It may be of assistance when troubleshooting noise sources. Be careful where you put it with the engine running !

1527. 9323 won't tune up my 9350 at all.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-06-23 10:48:33 UTC
From: gsnibson
Topic: 1527 Message: 1527

Hi,
I was wondering someone would have some suggestions on a problem I have got with my 9323 and the 9350 not tunning. I know these problems seem to come up often, but the problem I've got seems a bit different, in that the motors won't seam to fire up at all.

When I press the TUNE button (regardless of which channel) I get the usual tunning beep then tune fail straight away. The motor in the auto tune doesn't seem to even try to fire up. I have plugged the antenna into a friends 8353 and it works fine, so that discounts the Antenna (I think ?). I have then replaced the coax from the unit to the antenna and that didn't help. I then tunned a scanner into the freq to check if the unit was actually transmitting on pressing the tune button. Yes that was working. So I think this leaves me with either the 9323 Unit or the control cable to the antenna. Now I have continuity checked the cable and it seems fine, though I can't check if a voltage drop has occurred over that distance that might affect the Antenna. I did notice when I changed the antenna back from my friends that on pressing scan the antenna the motors did make a brief noise, as it should, but that's the last I've heard from it. I double-checked all my earthing and to ensure that was fine.

I've reached the end my ideas and it looks like I'll have to send it to Codan. But that's a day without the car and Seaford(Vic) is not just around the corner for me.

Does anyone have any suggestions?

Thanks for you help in advance.

1528. Re: [codan_outback_radio] 9323 won't tune up my 9350 at all.

From: Sam Point
Topic: 1527 Message: 1528

You haven't re-installed or installed the antenna control cable just before this problem surfaced have you? If you did, was the 15 pin "D-Shell" connector removed to help with feeding the cable? If so check that the "blue" and "green" wires in the connector haven't been put on the wrong pins (Use the 8528 or 9232 manual for reference or try Ben's site.), both wires sit next to each other.
The reason I suggest checking this. I have had 4 vehicles over the last 6 months show similar faults. All had those 2 wires transposed. This had happened when someone had replaced faulty cables out in the field, possibly in low light, as both wire colours can appear similar in certain lighting conditions.
Just my 2 cents worth. The last one was on Tuesday of last week, it had 2 of our techs stumped until I suggested they check the wires, they checked and saw the blue and green wires had been transposed!
Regards,
Sam.

Thats HF dedication, to fix the radio get a new landcruiser.(replace everything between the number plates ??)
poor old 60 series....

On Saturday I was changing the fuel filters on my 2H landcruiser, I was listening to 8525 at the same time, what I did notice (and have on other HF radio's in my vehicle) was whenever I touched the fuel lines with with a tool (I was bleeding fuel lines at time) it would cause static noise on the radio- partiular when cracking the bleed nut at fuel filter,

I have heard of injector pumps causing noise before but I was a bit sceptical to how accurate this might be, - a tick tick noise may very well be injector related. If you place your hand on injector lines you may feel a tick type knock - maybe pump or maybe even mild diesel knock from poor injector? but I am no mechanic, I am sure others out there would have far more knowledge about diesel engines-

just another angle to look at

regards

Paul

Hi,

Just a wildd guess,
but could it be the Hall effect sensor on an injection pump?
Place an earth lead on the pump and try again.

Cheers,

Stefan.

Hi,

I have one on my 1HZ for the tacho,
It is a semiconductor that picks up magnetic fields.
They can be very noisy.....Bad.....
Not sure how far back they go on Landcruisers.

Cheers,

Stefan

Topic: 1520 Message: 1534

Tacho sender on 2H is on the left hand side of the bell housing, it is in a prick of a spot to get too, my tacho did not work on my vehicle when
I got it and it took me ages to find out where it was. No one including toyota seemed to be to tell me where it was. In the end I used an 'F' set for telephone pair identification to find it - I have since found the F set is very handy at finding cables in looms in vehicles

Tacho in 2H gives a sine wave output(I have looked at it with CRO), it changes in frequency with engine speed then the back of tacho meter has circuit to convert to analogue meter.

In early Hiace, Hilux and 2H landcruisers it can give a hi pitched noise around 1Khz at about 1000rpm and so on - you will usually hear through stereo speakers with radio turned down.

This interference does not sound like tacho noise which is not pure dc and up electrical noise, anyway:

to isolate tacho noise just disconnect the circuit from back of tacho on dash or unplug tacho sender near gearbox/transfer case loom

As far as I know the injector pump on 2H is strictly mechanical, the engine control unit which bolts on behind the pump may have some electrical goodies but I dont know what they are- probably solenoid to cut fuel off???? never had to worry about it.

Regards

Paul

Spent a lot of time playing with L and C filters on the oil pressure sender unit. In the end I just pulled the wire off and kept dipping the oil at every fuel stop. I wasn't so lucky with the fan motor and windscreen wipers.

Subject: Re: [codan_outback_radio] Toyota Landcruiser.....NGT..... and noise

Tacho sender on 2H is on the left hand side of the bell housing, it is in a prick of a spot to get too, my tacho did not work on my vehicle when
I got it and it took me ages to find out where it was. No one including toyota seemed to be to tell me where it was. In the end I used an 'F' set for telephone pair identification to find it - I have since found the F set is very handy at finding cables in looms in vehicles

Tacho in 2H gives a sine wave output(I have looked at it with CRO), it changes in frequency with engine speed then the back of tacho meter has circuit to convert to analogue meter.

In early Hiace, Hilux and 2H landcruisers it can give a hi pitched noise around 1Khz at about 1000rpm and so on - you will usually hear through stereo speakers with radio turned down.

This interference does not sound like tacho noise which is not pure dc and up electrical noise, anyway:

to isolate tacho noise just disconnect the circuit from back of tacho on dash or unplug tacho sender near gearbox/transfer case loom

As far as I know the injector pump on 2H is strictly mechanical, the engine control unit which bolts on behind the pump may have some electrical goodies but I dont know what they are- probably solenoid to cut fuel off???? never had to worry about it.

Regards

Paul

Jim <jimshire@...> wrote:
Ah, thanks for that. I seem to remember a tacho in my HJ60, not sure. It was
the oil pressure sender unit that gave me curry, that much I do remember.

Topic: 1527 Message: 1536

I had the same problem with my 8528/8558. I could hit tune, and it would almost instantly come up with tune fail, and there was no movement in the tuner. The radio indicated that it was transmitting, and I was totally MF over it. A suggestion from the group was that the final tranny's had gone (bad as they are a matched pair, which means big dollars), so with a heavy heart, I took it into the local radio tech (fortunately only a km from where I was working at the time), and had them look it over. Turned out that the finals were fine (phewwww), rather it was the drivers that were cactus. There was a very small amount of power (which accounted for me being able to hear it on another HF radio), but nowhere near enough to tune.
If your mate is happy, try using your radio to drive his tuner - if it does, then the radio is probably fine - if it doesn't, then you will need to take it to the radio doctors.
Another way would be to put a power meterinline, and see what the output is (that was how I found my problem) - from memory, the codans use a carrier somewhere between 5 and 10 watts to tune. If you get zero to maybe a watt, then your problem is with you radio - either finals or drivers.

Subject: [codan_outback_radio] 9323 won't tune up my 9350 at all.

Hi,
I was wondering someone would have some suggestions on a problem I have got with my 9323 and the 9350 not tunning. I know these problems seem to come up often, but the problem I've got seems a bit different, in that the motors won't seam to fire up at all.

When I press the TUNE button (regardless of which channel) I get the usual tunning beep then tune fail straight away. The motor in the auto tune doesn't seem to even try to fire up. I have plugged the antenna into a friends 8353 and it works fine, so that discounts the Antenna (I think ?). I have then replaced the coax from the unit to the antenna and that didn't help. I then tunned a scanner into the freq to check if the unit was actually transmitting on pressing the tune button. Yes that was working. So I think this leaves me with either the 9323 Unit or the control cable to the antenna. Now I have continuity checked the cable and it seems fine, though I can't check if a voltage drop has occurred over that distance that might affect the Antenna. I did notice when I changed the antenna back from my friends that on pressing scan the antenna the motors did make a brief noise, as it should, but that's the last I've heard from it. I double-checked all my earthing and to ensure that was fine.

I've reached the end my ideas and it looks like I'll have to send it to Codan. But that's a day without the car and Seaford(Vic) is not just around the corner for me.

Does anyone have any suggestions?

Thanks for you help in advance.

I've been told that the finals from either the 6801 or the Tracker tranceivers are replacements for the 25/28 series. I'll have to check it out, does anyone know offhand ?? Cheaper to buy an old scrap radio on ebay than pay for new finals...maybe :))

I checked it out in a couple of areas. I found that Lee Andrews (Andrews Comms) in Sydney were able to sell me a matched pair for less than half of what the shop was quoting me. When I asked why such a hugh price difference, they said that in order to be a codan dealer, they had to agree to use only Codan genuine parts (in other words, the same parts, but sourced from Codan with their large markup). Not to sure if this was just their coverup of their excessive prices.
It was about a year ago that I had the problem with the power output, so cannot remember much more other than that.

MRF455's are about $35-50 ea depending where you go. If you are looking around hamfests, private sales just make sure that they have the same coloured dot, this indicates a matched pair. there is usually a number stamped as well.
You might get away with MRF454's(can be easier to find) but type approval would be compromised.

When I was originally testing my auto tune it would fail when the power sensor in the radio detected no RF. (I think from memory the autotune circuit looks for RF as a condition proir to driving the motor). Sounds just like the fault being described (about 2 secs of radio tuning, no motor drive then uT error, turned out to be the RF lead to the PA board from the mother board, I cleaned the pins and tinned them with solder and have not had a problem since.

Stefan,

I think the 2H had a Hall effect sender for the tacho but the 3B had the tacho drive in the alternator.

I think you may be onto something with that.

To answer the other question, the 8558 tune mod is just an impedance change that is necessary with some 80series due to earthing probs with chassis to body....just tunes up properly no faster.

To answer Jim I recall some time back there was comment on either this list or the 80series list regarding problems with the 100 series 1HDFTE engine and a 9350. Whenever the radio answered a Selcall it would interrupt the engine ECU and the engine would cut out. No amount of shielding seemed to help the owner. Was apparently quite dangerous as it would happen any old time eg 120kph overtaking etc.

Cheers

Craig

Many thanks for all the comments. The problem persists. Just to give an indication how "tricky" it is.....

Talking VKS737 frequencies...without going down stairs to have a look, I think the highest "737" freq: is 14.977 Mhz. If I disconnect the alternator all noise on that frequency and higher STOPS\DISAPPEARS...it's unbelieveable. However, even with the alternator offline, the tick, tick, ticking reappears as the frequency is lowered and by the time I get to 14.116 (Ham Travellers Net)it is back at full strenght. I understand the theory, but it 'aint gettin easier!

Maybe I should give HF away and buy an electric train set?????

Just kidding, but I sure hate to be beaten by a bloody noise!!!!!

ooroo....Mike....\\

Mike you obviously have a real problem there. I'd just go through the list methodically starting with pulling the lead off the oil pressure gauge sender. The noise may be generated by several sources at once. Perhaps the voltage regulator might also be suspect ? I seem to remember replacing mine with a solid state unit.

Many thanks for all the comments. The problem persists. Just to give an indication how "tricky" it is.....

Talking VKS737 frequencies...without going down stairs to have a look, I think the highest "737" freq: is 14.977 Mhz. If I disconnect the alternator all noise on that frequency and higher STOPS\DISAPPEARS...it's unbelieveable. However, even with the alternator offline, the tick, tick, ticking reappears as the frequency is lowered and by the time I get to 14.116 (Ham Travellers Net)it is back at full strenght. I understand the theory, but it 'aint gettin easier!

Maybe I should give HF away and buy an electric train set?????

Just kidding, but I sure hate to be beaten by a bloody noise!!!!!

Yes, I remember replacing the regulator in one of my Toyota's trying to solve the problem too. Had to buy one as they wouldn't let me try it first and it didn't help either, all I ended up with was a new regulator plus interference. I remember a friend of mine who new a lot about interference in Ambulances with AM RT's and he said interference can often come from the rev counter gauge inside the dash board!!!! He has spent years perfecting suppression problems and was more than happy when they changed to FM RT's.....doesn't help us much though..... :-))

If the radio had a long bit of coax with a 50 ohm resistor on the end waved around the engine bay it might at least point to any RF source . Wouldn't help if it were coming in over the DC I guess.

Could do, but I've always found interference only really occurs when all is in situation. i.e. coax not connected to antenna base, problem goes away, aerial base not connected to vehicle but connected to set, problem goes away, Could try attaching set to a battery that is in radio area, that might eliminate the question of whether it is coming up the power cable, then again, as above may be the case. :-)) As this is a remoted set that we are talking about, I still have my doubts about the screening in the radio /head cable and the connecting cable to the auto tune antenna.....want real hard work, try a new 90 series Landrover with the computerised injectors..... they generate RF for about a 4 mtr radius circle around the vehicle. Bit like a wall to RF coming in.

A little while ago there was mention of someone who was not honouring COD payments through ebay, sold.com and on VKham,

Did this person state that they were from Tasmania?

If anyone has any info would they shoot me a quick email off list.

Regards

Paul

If anyone is in the market for an 8551 box (the bit that goes between an 8525A and the 8558 autotune aerials) please email me. We've found a supplier but have to order them as one lot. Apparently they are brand new and should be round the 100 mark. Now if only I could find some more 8558's there would be a lot of happy people out there :))
Cheers
Jim

1550. 9323 for sale

Hi all,

yesterday I put an ad for a 9323 on
http://www.exploroz.com.au/Trader/View.asp?Type=For%
20Sale&TraderTypeID=4
I have 2 at the moment.

You will also see an ad there for an NGT but I do not have one at
the moment,

From: Phil Smithdale
Topic: 1551 Message: 1551

If anyone wishes to discuss purchasing a unit from Peter I can vouch for the products he has for sale, as I am now the owner of a Codan NGT from Peter.

My unit is in very good condition and Peter is extremly easy to deal with.
All questions were answered immediately and honestly.

Contact me off line if anyone has any queries.

Regards

Phil
Mandurah WA

PS. I would like to hear from any NGT owner in the Perth area.

Hi,

Can anyone tell me what the frequency coverage is in a 7727-T and a 7727-C. I am considering doing one up for VKS737 but i would like to know if it will make it up to 14977Khz before i order the crystals.

Thanks
Daniel

Daniel, off the top of my head they will do to 16mhz. If they dont, you will only lose that one channel anyway.

Daniel,

The 7727 will run 14977MHz, but it requires different inductor-tuners
than standard. These tuners are rare and out of production. I doubt
you'd be able to get any (although this list could produce just about
anything I reckon!).

While I have used 14977MHz, it has not been often required and is
easy to live without IMHO.

The 7727-C will do 2 to 16 MHz. You can have 10 single frequency
simplex, or 5 two frequency simplex,
in any combination that does not exceed the crystal capacity.

Cheers,
Alex
